

Common Walkway / Patio Problems

- Moss and weeds growing in between joints separating bricks/pavers

- Surface stains/bacteria cultivating on your walkway

- Sinking/rising bricks that may be caused by roots or loose soil

- Poor drainage causing water to pool up and accelerate erosion

Your walkway or patio could be next!

What is Polymeric Sands?

Our Process for Patio & Walkway Restoration

We Also Do Installations & More!

Polymeric sand is a material used to fill in between paver, brick, or stone joints. It is a long-term solution to keeping hassle-free patio maintenance. Polymeric sand has several benefits that include:

- **Increased Durability**

Polymeric sands create a strong but flexible joint that will not crack or decompose. This means once it is applied, it is there for good.

- **No More Weeds or Ant Infestations**

Polymeric sands hold pavers together more homogeneously than conventional jointing material creating an almost impenetrable joint that weeds and ants cannot get through.

- **Rich and Varied Colors**

The color of your joints ties your whole masonry walkway or patio together, so it is important to find the right fit for your style of project.

1.) **Surface wash and clearing debris from in-between joints**

It is important to remove all moss and weeds from between joints to give about 1/2-1 inch depth to allow for polymeric sands to bond strongly. This step will get your walkway prepped and looking new already!

2.) **Leveling out any sinking or raising brick/pavers**

Bricks that are caving in or being raised up is a sign that your walkway needs maintenance. Roots from surrounding trees or poor compaction may be impacting your walkway safety. We will go to whatever depths specified to make your patio like new again!

3.) **Apply polymeric sands using plate compactor to assist**

After your walkway is all clean and leveled out to your expectations, the next step is to prevent weeds and moss from getting into your joints again. Our trusted polymeric sands has a 20 year manufacturer limited warranty that proves it is meant to last! To ensure all joints cure to their strongest, we use a plate compactor to help vibrate sands deeper into the joints allowing for a longer-lasting weed-free patio!
