

Alpha-Stim MET/CES

for Pain, Anxiety, Insomnia and/or Depression

Alpha-Stim is a device that replicates the body's natural biological signal to restore cell function back to its rebalanced/normal state (through electrical synapse activation and synchronization) while introducing a pleasant, relaxed feeling of well-being.

The CES-only "AID" Device delivers a wide spectrum of targeted and specific biological low-frequency (0.5 Hz) therapeutic Cranial Electrotherapy Stimulation waveforms to treat anxiety, insomnia and depression; with secondary effect for the treatment of pain.

A second "M" Device (which includes CES) adds a more focused Microcurrent Electrotherapy component using the same waveform through the site of pain; applied with probes and/or pads in a 3d plane.

Traditional stim devices tend to approach treatment by suppressing cell function. Alpha-Stim bathes the body in a variety of harmonic frequencies to improve cell function and restore structural and functional symmetry.

Alpha-Stim is safe, effective and cumulative without side effects, addiction or accommodation; with a response that is often equivalent to or better than outcomes with medications.

Patients often experience a significant reduction in pain, anxiety and depression, as well as great success for those suffering from insomnia.

Alpha-Stim is supported by well over 100 independent studies, has been in existence since 1981 and used by 10 million patients.
