

Alpha2Active

Stop the Progression of Cartilage Breakdown

- Alpha-2-Macroglobulin, located in the blood, prevents the breakdown of cartilage while protecting the joint.
- Inflammatory cells are removed while retaining and concentrating the A2M component by over 6x.
- Processed from your patient's own blood and injected directly into the affected joint or disc space.
- The process is centrifugation, filtration and injection.
- Available Fibronectin-Aggregan Complex Test pre-injection to determine efficacy. No-charge and takes 2 weeks to report.
- White Blood Cells are minimized to eliminate unnecessary pain.
- Eliminate the underlying source of arthritic joint or back pain.
- The A2M molecule attaches to and removes the destructive enzymes that are known to damage cartilage cells and tissues in the joint or disc space.
- The naturally occurring A2M molecule is the body's own defense mechanism, but may be unable to enter the joint or disc space in high enough quantities due to its large size and complex structure. Breakdown may happen when the joint or disc space contain more destructive enzymes than the body can handle.
- Create the balance necessary to bind to and remove the destructive enzymes.
- Achieve significant and long-lasting pain relief.
