

Fat Harvesting - Water-Assisted Liposuction

The Water-Jet Method is a well-established liposuction procedure to harvest fat for aesthetic purposes. With the use of a gentle spray (to loosen fat; and simultaneously aspirate) there is almost no destruction of fat cells or surrounding tissues during the harvesting process.

Tumescence is not required.

Shorter overall procedure time.

Change of cannulas for infiltration/aspiration is not required.

Centrifugation of harvested fat is not required.

Much higher quality of harvested fat.

- Almost all procedures can be performed under local anesthesia.
- Patients experience less pain during procedures and after surgery; and have shorter recovery times.
- High survival rate of fat cells in a truly closed system. Harvested fat is ready for reinjection without processing.

The Water-Jet Method is becoming the standard in lipedema treatment due to the **gentle technique** - lipedematreatment.org.

Water-Assisted Liposuction is a new way to view fat harvesting. Our support is unequalled, to include a large network of Partner Physicians to consult with, and will ensure a short learning curve with outstanding results; **and we always begin with Patient Trials.**
