

# Fat Harvesting - Water-Assisted Liposuction

The Water-Jet Method is a well-established liposuction procedure to harvest fat. With the use of a gentle spray (to loosen fat and simultaneously aspirate) there is almost no destruction of fat cells or surrounding tissues during the harvesting process.

**Tumescence is not required.**

**Procedure times are shorter.**

**Change of cannulas for infiltration/aspiration is not required.**

**Centrifugation of harvested fat is not required.**

**Much higher quality of harvested fat.**

- Almost all procedures may be performed under local anesthesia.
- Patients experience less pain during the procedure and after surgery; and have shorter recovery times.
- Harvested fat is ready for reinjection without processing. The survival rate of fat cells is very high.

The Water-Jet Method is becoming the standard in lipedema treatment due to the **gentle technique** - [lipedematreatment.org](http://lipedematreatment.org).

Water-Assisted Liposuction is a new way to view fat harvesting.

**Outstanding Training and Support**, to include a large network of Partner Physicians to consult with, will ensure a short and complete learning curve with exceptional results; **and we always begin with 2 or 3 Patient Trials.**
