

# **Serres Surgical Fluid Management**

## **Optimize, Modernize and Minimize Cost**

- Disposable suction bags and reusable canisters - 1000, 2000 and 3000ml. Integrated bacterial filter and overflow protection to protect your patient and the central vacuum system from contamination. Adapters available for most existing brackets.
- Specifically designed for low and medium-volume cases. 2/3 of all cases may be considered low-volume surgical cases - producing less than 2 bags of fluid waste. Medium-volume will generate 2 to 4 bags of waste.
- Will complement/not replace your larger system.
- Solidifying agent available separately or pre-inserted; if desired.
- Canisters are often used individually, but up to 6 can be connected into a single chain.

**Unparalleled User-Friendliness**

- Reusable canisters minimize waste and hidden costs. Serres' closed system will prevent leaks and spills while decreasing the risk of infection for patients and staff.
- The Serres Suction Bags are DEHP-free (which eliminates the risk of exposure to your patients). Serres Bags, too, contain 58% less plastic than other systems and will save you up to 88% of the space on hand for storage. Disposal costs and environmental impact are minimized.
- Significantly Streamline and Improve Your Workflow
