Landfill Hydroseed

## THE PROCESS

Hydroseeding is fast, efficient, and economical. This grass planting process is usually more effective than conventional seeding, and certainly more economical than conventional sodding. The process begins by mixing mulch, seed, fertilizer, and water in the tank of a hydromulching machine. The mixed material is then pumped from the tank and sprayed onto the ground. The material is often referred to as a slurry, much like a soupy batch of green papier-mâché. Once applied to the soil, the material enhances initial growth by providing a microenvironment beneficial to seed germination.

## ProGanics™ Biotic Soil Media™ (BSM™)

Many construction sites have depleted soils with low organic matter that require more than just fertilizer and other amendments to establish sustainable vegetation. Placing costly imported topsoil over depleted soils has historically been the preferred option to establish vegetation. Hydroseeding Solutions, LLC uses ProGanics™ Biotic Soil Media™ (BSM™) in place of topsoil on challenging and difficult-to-access sites, which will not only save money and time, but will also provide a growing medium that helps establish vegetation.
