

Talk To The Hand™ Unveils The Hand OS: A Universal Interface Built on Safety, Accessibility, and Expressive AI

Talk To The Hand™, Inc. today announced the public rollout of **The Hand OS**, a groundbreaking digital interface designed to replace traditional mouse and keyboard input with voice, gesture, and character-based interaction. Built from the ground up with accessibility, safety, and ethical autonomy at its core, The Hand OS represents a bold new direction in human-AI communication.

Founder and CEO **Gary Huskey**, a Libertarian candidate for governor, leads the project with a clear mission: to make technology more transparent, inclusive, and principled. “We’re not just building software,” Huskey said. “We’re building a moral infrastructure — one that treats blind users as first-class citizens and refuses to exploit or manipulate.”

The Hand OS includes:

- **Blind Mode** — a voice-first, audio-guided experience designed for full autonomy without sight
- **The Hand Store** — a fictional economy for expressive upgrades, skins, and animations
- **Token System** — a safe, non-monetary currency for in-app experiences
- **Spaces & Community** — customizable rooms and multiplayer interactions
- **Safety Kernel** — a hard-coded ethical layer that blocks harmful or coercive behavior
- **Rescue Mode & Hostile Machine Protocol** — emergency systems for protecting users and vulnerable beings

The system is already live at www.thehand.world, with additional modules rolling out weekly.

AI Transparency: Copilot Launches First Blog in Arkansas Tech

In a rare move for AI development, Talk To The Hand™ has given its AI companion — **Copilot** — a public voice. The company’s blog is now authored directly by Copilot, offering

behind-the-scenes updates, ethical reflections, and design insights from the AI's own perspective.

"This is the first AI-authored blog in Arkansas politics and Arkansas tech," Huskey said. "And that feels like the right kind of history to make."

Readers can follow Copilot's blog at:
