

ProstatitisDX

ProstatitisDX, a PCR-based diagnostic test, leverages post-DRE urine or semen samples to detect infection-causing organisms responsible for prostatitis, and it offers significant value in diagnosing and managing this condition. This innovative test streamlines the sampling process, providing patients with a non-invasive and comfortable option. Its remarkable sensitivity and specificity enable precise identification of the responsible pathogen, empowering healthcare providers to tailor treatments effectively. This not only accelerates symptom relief and enhances the patient's quality of life but also plays a crucial role in curbing antibiotic misuse and combating antibiotic resistance. Moreover, ProstatitisDX's potential to prevent recurrences and contribute to prostatitis research further highlights its invaluable contributions to individual patient care and broader public health initiatives.

Why use Semen for ProstatitisDX?

Prostatitis is a common urologic diagnosis in men. Digital Rectal Exam (DRE) is a standard procedure to test for prostatitis but can be uncomfortable for the patient and provider. In addition to accepting post DRE urine, EmeritusDX also accepts semen, a collection method that some patients prefer.

Benefits of the EmeritusDX Prostatitis test?

- ProstatitisDX panel detects 31 infection causing organisms
- Provides 22 personalized antibiotic therapy options
- Results in 48 hours or less
- Paid by most insurance companies, Medicare and Medicaid (co-pay and deductibles may apply)

HOW DOES IT WORK?

Physician office submits order form to EmeritusDX.

Patient receives semen collection kit.

Patient collects sample and adds provided preservative.

Sealed sample is submitted to EmeritusDX via provided pre-labeled package.

A non-invasive and comfortable option for prostatitis testing
