

ProstatitisDX™

Precision Detection for Prostatitis Management

ProstatitisDX™ is a PCR-based diagnostic test designed to identify infection-causing organisms associated with prostatitis using post-DRE urine or semen samples.

By enabling precise pathogen detection, ProstatitisDX™ helps clinicians make faster, more informed treatment decisions. Non-invasive collection options improve patient comfort and compliance while supporting targeted therapy selection and better clinical outcomes.

Why Use Semen for ProstatitisDX™?

Prostatitis is a common and often difficult-to-diagnose condition in men. While post-DRE urine is frequently used, the Digital Rectal Exam (DRE) can be uncomfortable for both patients and providers.

Semen offers a more comfortable, patient-preferred alternative, helping improve compliance while maintaining diagnostic value.

Why EmeritusDX?

- Flexible collection options designed for patient comfort and compliance
- Rapid turnaround times to support timely treatment decisions
- Advanced molecular diagnostics with clinically actionable results
- CAP-accredited
- CLIA-certified

Clinical Advantages of ProstatitisDX™

- Detects 31 clinically relevant pathogens associated with prostatitis
- Supports personalized treatment decisions with 22 antibiotic therapy insights
- Rapid turnaround time with results in ≤48 hours
- Flexible sample options: post-DRE urine or semen
- Broad insurance coverage, including Medicare and Medicaid*
