While unwanted animals in the attic can be a problem all year round because the climate cools down and we all want to spend more time at home if the creatures of the neighborhood think about pulling with them. In order to prevent animals from searching for refuge in their inviting mezzanine (and thus in other parts of the house), you must ensure that the parasites do not arrive through the roof. The best time for this is in spring and summer when it is still hot outside and the local fauna does not necessarily hunt the new habitat. Windy days? You might think that there are creatures that run around, but the noises that are pleasant or spin to the sound of the loft fan. This type of noise can not only be annoying, but can also be a big problem and should not be ignored. Strong winds can loosen or even remove the tiles, especially along the edges of the roof, on which the groundwater or the roof area hit the facade or tiles. The increased or missing tiles can cause losses (and possibly rotten) if the air humidity penetrates below and influences the coating of the roof below. 07-18-2023. According to the US Ministry of Energy, traditional darker asphalt roofs can reach 150 ° F on a sunny summer day. And longer exposure to high heat because it can damage the roof 14-07-2023 roof. 14-07-2023
