And it's priced right ! Our competitors charge more for much less. Contact us today to see how GWT can change the way you do business.

BARCODE SOLUTION

Major Features of barcode solution Software :

Creating labels and barcodes can be difficult without specialized software. Luckily, there are a variety of choices when it comes to choosing the right barcode software for your business. Different brands will have different printing capabilities, so it's important to know what kind of barcodes you want to make. If you need to print 2D barcodes, you'll have to make sure your barcode software supports that, for example.

- Physical or Digital barcodes: When choosing your barcode generator software, it's important to keep in mind whether you plan to physically print barcodes, or if you intend them to be read digitally (for example, barcodes on your website or designed to be viewed on a mobile phone, like a coupon). You'll want to use the right barcode generator software for these tasks to ensure that you get barcodes in the right dimensions and with the right level of detail.

- Different types of barcodes: Printing barcodes with barcode software is fairly simple, but you do need to know what you intend to print. You'll want to decide if you're printing 1D or 2D barcodes, QR codes, and so on. Different barcode generator softwares excel at different types of barcode, so choosing the right barcode software is a major decision point in your barcoding project.

INVENTORY AND ASSET TRACKING SOLUTION

Inventory and Asset Tracking :

Major Features of Inventory and Asset tracking solution:

Collecting and maintaining accurate records of your fixed assets can be a time consuming and expensive task. The right integrated solution will put your company's valuable equipment firmly under your control. The goal of any robust system is to maximize your asset control efficiency and minimize your equipment loss.

- Barriers
- Entry and Exit Terminals
- Interactive Video System
- Manual Cashier Kiosk
- Automated Payment Machines or Pay on Foot (POF)

MAIN COMPONENTS OF RETAIL ERP SYSTEM

A cloud-based ERP system includes components to ensure that every business area within the organization relies on a single source, allowing staff to make better decisions faster. The main components of a retail ERP system includes the following:

Retail Planning:
ERP for retail allows retailers to undertake planning activities as per the need of the situation. It focuses on the different strategies to be employed in order to help a retail store increase sales turnover.
Store Operations – ERP for retail helps streamline operations related to the store management function. The store operations are central to retail chains since market basket analysis, merchandising, inventory management, workforce management and much more is part of this.

Inventory Management:
This component enables retailers of all types and sizes to effectively manage the inventory levels and track goods. Inventory Management is the process of overseeing the constant flow of units into and out of an existing inventory. Inventory often accounts for the highest proportion of the working capital as raw material, WIP and finished goods.

Supply Chain Management:
ERP for retail manages the end-to-end supply chain for retailers. Shipping of products or materials dealing with potentially massive amounts of data scattered throughout the world, ERP systems can help ensure information stays interconnected and can be easily accessed by all relevant stakeholders.

Demand Forecasting:
Tracking past trends and forecasting future demands is easier and higher on accuracy with ERP for retail. Maintain customer satisfaction, maximize sales and reduce inventory carrying costs with ERP for retail.

Vendor Management:
Capture vendor details, lead time, performance and other vendor details. Perform comparison between vendors and choose preferred vendor with ERP for retail.

Customer Management:
Customer management becomes easy with the automated processes for capturing customer data, preferences and activities with ERP for retail. Track and increase customer lifetime value with ERP for retail. Get new customers, identify your best customers, keep them engaged and build your brand.

Finance Management:
Retailers can manage their accounting easily with ERP for retail as it provides a comprehensive set of tools required to manage all the financial aspects of your business, while maintaining a high level of regulatory compliance.

Database Integration:
A comprehensive ERP for retail helps in process management and provides access to real-time reports. ERP makes the required data available to provide insights into the financial health of a retail business. Moreover, this component of retail ERP systems is used for generating specific compliance reports.

SOFTWARE

Retail Software :

The best retail software is that which helps user provide the most accurate information regarding the sales transaction happening in the stores, so that it can be utilized for increasing the profit margin of any business store.

SOFTWARE SOLUTION

Major Features of Software Solution:

Software development is the phase when the actual process of application development begins and to ensure that we develop the best value added application for our customer, we use the latest technologies that allows us to create the finest software component. As an experienced service partner to numerous renowned companies we are aware of the challenges of mobile computing, like time management-memory usage- database optimization etc moreover, we are also aware of the desired level of robustness of software components for any AIDC solution. Thus we make it a point to keep an end user involved in the development process and demonstrate the application to him/her to get feedbacks and make the desired changes (if any).

— Source Code maintenance

— Minor modifications & enhancements

— Change Request Managements

— Standard Software Support

— Telephone Assistance

— Critical On-Site Software Support

— Remote Access/VPN

WAREHOUSE MANAGEMENT/ MOBILITY SOLUTIONS

Warehouse Management and Mobility Solution :

Major Features Warehouse Management and Mobility Solution Software:

Proper recording and management of physical stocks is important for any business to be profitable. Warehouse and Inventory Management solutions offered by us cover many businesses like Manufacturing, Trading, Logistics, etc. Apart from keeping track of Incoming, Outgoing, In Process, Stock Transfers, etc., our solutions can work with Portable Data Terminals and Rugged Mobile Computers. Talk to our expert account managers and they will be able to visit your facility and suggest the most cost effective solution for managing your inventory and warehouse

— **Receiving:** Gain insights into shipments that have been delivered, but that are not yet at their final location. Make sure items at low stock levels are staged and put away first, reducing the impact of out-of-stocks and inefficient fulfilment processes.

— **Put-Away:** Know the location of all inventories on your shelves. Route your workers to the right location, set up their picks in the proper order to minimize travel time, and increase the number of orders they can pick each day.

— **Picking:** Improve error-proofing and productivity in the picking process. Workers receive their picks on a mobile device that routes them to the proper location. Scanning items when you pick them verifies that the right item at the right quantity is picked.

— **Packing/ Palletizing:** Ensure the accuracy of each order that is picked and reduce material costs by determining the right sized shipping carton.

— **Shipping/Dispatch:** See that each order is properly packaged and shipped to the right destination and delivered on the right date.

— **Physical Stock Taking:** Through Mobile Computer Inventory count can be done by scanning each item barcodes. At the end of operation system generates material variance report location wise, Item wise.

— **Reporting Management:** The Warehouse Inventory Tracking System is designed to provide a wide range of useful enquiries and reports based on specific data analysis including current stock, item movement, etc.

— **Wi-Fi and Barcode System:** The Warehouse Inventory Tracking System is designed to provide a wide range of useful enquiries and reports based on specific data analysis including current stock, item movement, etc.

NETWORKING SOLUTIONS

Your Solution for Business Networking

We are a full service company for all of your network requirements. Bluechip caters to the network needs of small to medium sized companies that do not have full-time IT staff. We also contract our services to larger companies that need assistance on their day to day issues or special projects.

Whether you have one computer in your business or a hundred at several office locations, Bluechip can provide the support you need to run your business with the highest degree of efficiency and network uptime. Our rapid response Help Desk ensures that any network issue you encounter will be handled quickly and documented properly in your case file.

Network Security

·   Firewall

·   Virus Protection

·   Intrusion Detection and Protection

·   Information Security Management

Our focus is on customer service. We believe that communicating frequently and educating you in the technology you use builds trust even if that makes you less dependent on our own services over time. We want to become a trusted advisor; just as we are with our other satisfied clients

Network Design, Implementation & Support We design your network with consideration for future growth and new locations. We perform troubleshooting of every network issue to complete resolution.

Remote Access & Virtual Private Networks (VPN's) For the telecommuting employee that works from home or on the road, we provide solutions that allow fully secure access to the company network, applications and e-mail.

Internet Connectivity & E-mail If you have problems with internet connectivity or simply want a more reliable internet service, we help you find the solution that best fits your needs. We administer in-house e-mail and web servers.

Network Security & Firewalls Hackers, viruses and worms can cause grave consequences to today's systems. We protect your company network with anti-virus applications and hardware solutions (firewall).

Network types

Bluechip provides solutions for all types of networks. Understanding the varying system features will help you in selecting the network that best suits your needs.

Personal Area Network (PAN)

PAN is the smallest of the network types. This network consists of an individual's computer and any connecting devices, such as printers, PDAs or iPods.
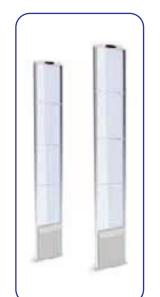

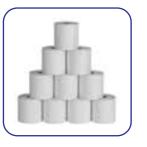

Local Area Network (LAN)

This is the most common type of network solution. It connects you to multiple computers in your home or work via cable or wireless connections.

Metropolitan Area Network (MAN)

MANs usually connect LAN and WAN in a metropolitan area and do not extend past a city or town's geographic boundaries. This type of network is generally open to the public.

Wide Area Network (WAN)

This network type is a step higher then MAN networks. They cross city and national borders with the use of routers. WAN networks are not open to the public like MAN networks.

Peer-to-Peer Network

This type of network gives all of the computers on the network equal importance. Each computer contains all of the software and data used throughout the network, and each user has complete access. This type of network is generally found in small businesses.

Campus Area Network (CAN)

This network solution is used on university campuses, where networks in multiple buildings need to be connected. CANs are also used in industrial businesses, where offices are in multiple buildings, such as an industrial business park.

Intranet/Extranet

Intranet is a network run by a company that is used by employees to communicate internally. An extranet network is designed for internal company use and allows access to clients and vendors in the outside world.

Virtual Private Network (VPN)

VPNs allow users to access the Internet within private business networks. This network operates using a secure link and is generally used by remote business workers.

Client/Server Network

This network holds information in a central location (the server), while allowing access from other computers connected to the server. Computers connected can access and save files to the server. This type of network is used in many businesses. A primary benefit is all data is located in a central location, making it easier to back up and locate information.

Global Area Network (GAN)

Providing global coverage, GAN is the largest network solution. It is composed of different networks connected together, providing an unlimited geographical coverage area. This network uses a variety of technology to maintain network communication, including satellite.
