Care and Cleaning of Firearms—Overview

There are many different ways to use the list of inhibitors as seen below with firearms.

Depending on how gun owners who want to use the products store their weapons, such as in gun safes as an example the **Bullfrog Emitter Panel** is inserted into the safe (L X W X H to the 3rd, each 10" X 10" X 1/4" foam square impregnated with VpCI will protect up to 100 cubic foot enclosed space) will last for 1 year and protect everything metal in the safe against corrosion activity.

The **Bullfrog Emitter strips** are good for gun bags, insure the foam is not touching any metal/wood part of the firearm top insure that bluing & wood finish do not react with the foam.

Bullfrog Gun Wipes are a handy way to field clean your weapon, does not leave a tacky film behind. Emulsifies spent powder and can be cut to use as a patch when swabbing barrels after wire brushing has been performed. The combination of cleaning agents and rust inhibitors assure that oils left from the skin, spent powder and any other foreign substance left behind is removed and the dry film left behind prevents corrosion from starting.

CarWell CP90/RUST COP is a favorite of black powder enthusiasts as **CarWell CP90/RUST COP** lifts spent powder deposits and suspends them from both black and smokeless powder firearms. CarWell aids in breaking up caked powder deposits which can be easily lifted with a standard cleaning patch or use of the BULLFROG Gun Wipes. **CarWell CP90/RUST COP** is a thin film inhibitor which means the product will easily migrate to the tightest of assemblies to lubricate and protect the weapon as a whole for months at a time. If the weapon is stored out of the environment and in a case or safe, one can easily get a year or possible more for protection with the use of RUST COP. We always suggest inspecting your weapons once every 6 months to insure nothing was missed in the last firearm lay up if one has not be to the range or field to use the weapon.

Tests performed by Hawaii Army National Guard discovered smooth operation, excellent corrosion control and perhaps most importantly a reduction in weapon jam, however **CarWell CP90/RUST COP** is not meant as a replacement for out of adjustment clips or feeders as these systems require occasional adjustment to insure proper feeding of rounds will occur. **CarWell CP90/RUST COP** will insure that a smooth operation will occur and if the weapon is in proper adjustment the smoother operation means less handling noise (noise in handling: as in physical vibration due to irregular chambering of rounds) during target acquisition and rapid firing.

Bullfrog Lubricant is a medium film inhibitor that will leave a higher film behind than the thin film CarWell CP90/RUST COP. Bullfrog Lubricant film is designed so that years of protection will occur after application. Should the weapon owner want to lay up their weapons for a year or more, Bullfrog Lubricant will perform up to 3 years in open atmosphere, longer time interval for gun safe/gun bag storage. Again, 6 month interval inspections should not be halted as these inspections will insure you'll get what is expected with any application of CPC (corrosion prevention compounds).

Since there are more than one choice of ways to provide weapons protection, we leave it up to the consumer to decide what works best for them, while pointing out the differences of each product and what one can expect.

We have sold both Bullfrog and **CarWell CP90/RUST COP** at the gun shows at Blaisdell Center on Oahu for 15+ years. We have not had any complaints or returns and consistently get repeat orders and compliments on how these products work.
