Lubricant
Experience**

**A look inside the
“Value of
Performance”**

Texas Refinery Corp

Made in the U.S.A. since 1922

The smallest component of a business can have the largest impact on success and the bottom line. At Texas Refinery Corp we have developed something more than an extensive line of quality products, we have developed a culture.

When quality and performance are the primary goal of the manufacturer, the potential for success grows exponentially. Our additional steps allow you to operate above and beyond your expectations.

With manufacturing and delivery costs on the rise many companies seek new methods of cutting corners and increasing margins. At TRC we believe that delivery of the finest product is the only way to ensure the success of our company and yours. Just look at what goes into your lubricant investment.

Base Oil & Additive Package

Designing, developing and delivering a superior quality product begins with premium raw materials. At Texas Refinery Corp, we can assure our customers that the products they have chosen to protect their valuable equipment were developed using highly refined petroleum and synthetic base oils. In fact the industry refers to the base oils we use as "water white" due to the purity that allows for superior performance and excellent solubility with our industry best additive packages.

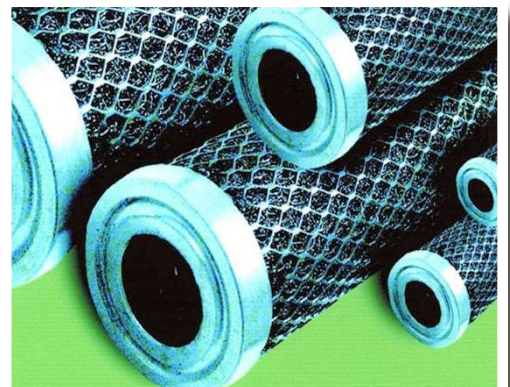

Quality Control Testing

Quality Control Testing is simply one more step taken by Texas Refinery Corp to ensure the products we deliver meet the highest of standards. With industry specifications allowing for varying degrees of quality, TRC develops products to meet our standards. By setting the bar higher than equipment manufacturers and our competition, we are able to provide products that exceed industry standards and our customer's expectations.

10 Micron Filtering

Lubricant filtration has proven to be an additional step that separates us from others in our industry. With experts in our industry touting the benefits of filtering lubricating oils before use, the value of this added benefit can be remarkable. At TRC all of our lubricating oils are filtered to 10 MICRONS before packaging, about one tenth the width of a human hair. The combination of quality materials, QC Testing, and the filtration process are three factors in the extended service life of the products we deliver. Understanding these additional steps, allows our customers to better understand the value and performance capabilities of our products.

New Containers

Packaging in new, unused containers is often neglected or considered unimportant by suppliers. Experts will tell you something different. While not using reconditioned containers does come at an expense, it ensures our customers that their investment is clean and prepared to accomplish the task for which it was designed. Regional and local lubricant suppliers rarely have the means to package in premium quality new containers and the performance of the lubricant is where this shortcut will present expensive problems.

Advanced Oil Analysis

An extensive Oil Analysis Program is the life line of any true preventive maintenance program. With our products designed to offer extended service life and superior protection, participating in TRAAP (Texas Refinery Advanced Analysis Program) is expected. The “no charge” program gives you the insight into the performance and value of our products, presenting you with the information needed to make educated choices. Extended drain intervals are risky with traditional

products. As you have read, TRC products are designed to run longer and protect better than any other products on the market. Take advantage of TRAAP, access your information via the internet 24/7, and maximize your lubricant investment.

“Lubrication management starts by changing the organization’s view of lubricants and lubrication . . . All too often, lubricants are treated as consumables, which must be purchased at the lowest cost. However, lubricants are in fact valuable assets that must be nurtured and cared for if the maximum in-service value is to be realized.”

Mark Barnes
Practicing Oil Analysis

“The path to lubrication excellence can be difficult to navigate. It begins when individuals and organizations become aware of the importance of their lubrication program, its impact on productivity and its direct effect on the bottom line . . .”

Jarrold Potteiger
Machinery Lubrication

“There are thousands of cheap lubricants on the market, and many of them have no business in your machines. There are also scores of premium brands formulated for quality and performance.”

Jim Fitch
Machinery Lubrication

“If you can’t measure it, you can’t manage it”

Dale Warner
Co-founder CEM Program
(Certified Equipment Managers)

On-Site Lab

In addition to designing superior quality products, our experienced lab technicians have analyzed products, examined failed parts, and helped our customers maximize the efficiency of their operations. Purchasing a superior quality lubricant is only the first step in a true preventive maintenance program. Having the resources to support that decision, makes a world of difference.

Freight Pre-Paid

At Texas Refinery Corp we know first hand the expenses involved with running a successful operation. We want all of our customers to know how much we appreciate their business and the opportunities we have been afforded. All above minimum orders will be delivered via one of our many warehouses across the continental U.S., and done so freight pre-paid.

No Interest Terms

Special No Interest Terms are available for qualifying customers. Ask your Local Lubricant Specialist or Regional Sales Manager today.

Experience

Texas Refinery Corp has remained in the Pate family since being founded in 1922. With countless years of experience our well qualified sales team, factory personnel, lab technicians, and management team, can deliver what few others can . . . a history of success. Those individuals and companies that choose Texas Refinery Corp are not only customers, they are part of the TRC family and treated as such.
