

Thanks for your interest in a custom Sportsman's Chest Rig with optic.

There are a few things we need to know about your weapon set up.

For a **Red Dot** or reflex sight, please send us a photo of your semi-auto or revolver with the optic mounted. Be sure to include a tape measure from the end of the barrel to the optic so we can make the proper cut-out in the leather. If this optic is mounted further down the barrel, we will need to follow the Scoped criteria below.

For a **Scoped weapon**, there are a few measurements we need to determine if your optic situation is a valid build.

First, we need a photo of your weapon with the scope mounted. Please include a tape measure from the end of the barrel to the first scope mount OR if the tactical rail protrudes, a measurement from the end of the barrel to the tactical rail (B).

A second measurement is needed for the smallest space between the scope and the barrel (A).

Criteria: The measurement from the end of the barrel to the optic or rail (B) must be 5 inches or more. The measurement between the barrel and the scope must be 3/8 inch or more (A). If your measurements meet the criteria, a custom holster can be built.

We will need to insert a metal liner between the leather layers to keep the holster from collapsing. The extra cost for this is \$50 on top of the cost of the holster and shipping.

The following are examples of builds that we cannot do.
