

The Global Alpha Certificate (CHF-hedged)

Investment Strategy

The Global Alpha Certificate (CHF) objective is to outperform the S&P Mid Cap 400 Index (CHF) over an investment cycle of 3-5 years. The portfolio follows a bottom-up stock selection approach based on a quantitative and qualitative investment process, which enables the discovery of fast-growing businesses. The process is combined with a continuous top-down review of macroeconomic, geopolitical, and other market stress factors to carry out asset allocation. The certificate invests in global listed equities, uses forward contracts to hedge foreign exchange exposure, long-dated options to shield the portfolio from major market crashes, and ETFs for safe haven assets.

July Investment Report

- July was unforgiving to technology, with many names within the AI complex surrendering close to -50%. The Global Alpha Certificate (CHF) gave back -20.4%, less than half that, a difference largely explained by when we chose to reduce risk.
- SpaceX's IPO on 12 June was the clearest symptom of a broader valuation excess, of which Rocket Lab at 90x forward twelve-month sales was one of the sharpest illustrations, and we lowered risk across the portfolio accordingly.
- We added it back late in the month, when strong quarterly results left several high-beta AI names clearly oversold on our quantitative models. The market validated the move within days, as August opened with a +5.6% session that lifted YTD performance to +28.7% against +17.8% for the S&P MidCap 400 Growth in CHF.
- Bloom Energy was one of the main triggers to our decision. Quarterly revenue of \$1.065bn, up 165.5% y/y and far above the \$827m expected, EPS of \$0.78, close to double the \$0.41 expected by Wall Street, and full-year guidance raised to \$3.9-4.2bn from \$3.4-3.8bn. With Microsoft, Meta, Alphabet and Amazon now guiding to \$720-745bn of 2026 capex, each having raised its outlook, the message was unambiguous: AI infrastructure demand still exceeds supply. Mid-July had priced a peak, the data described an acceleration, and we rebuilt exposure accordingly.
