security holopatch print

Introduction

True ID card security derives from several sources: card media, security-enabled card printers and other security features. Card media features include surface quality, card durability and other built-in security elements. A security-enabled card printer, such as Zebra's P620, can print finely detailed graphics and reliable bar codes, plus other covert features printed at time of issue. A third element of ID card security is database verification the card printer may be linked to a central archive that records user-selected information, such as personal statistics and photo of the card holder, license number, date, time and place of issue. Finally, ID cards may be secured through various unusual, covert and forensic features.
