

LOKII-CE boards User Guide V1.0

PRODUCT SPECIFICATIONS

SMART_SHIELD	ARM9 Multimedia Processor 256MB internal flash 320x240 LCD display 720P Camera module 802.11 a/b/g 2.4GHz WIFI module Bluetooth 5.0 module USB port
SMART_POWER	DC input: 6-8.5V @5A power source Support up to 40W power for external components. (SMART_DEVICES)
SMART_IO Extender (Optional)	17 Digital Input/Output board
SMART_ARDUINO (Optional)	Arduino compatible board with BLE connectivity
SMART_RC (Optional)	A SMART_DEVICE board which can drive 4 RC servo motor

Remark: Depend on your board order configuration, either SMART_IO or SMART_Arduino is bundled in the box.

SUPPORT

For more information, please visit www.btobsteam.com to get the latest support or send us email: btobsteam@gmail.com

INTRODUCTION

LOKII-CE boards are three boards stacked together to provide functions for user programming through standard Arduino IDE or LOKII-CE graphical IDE environment.

SMART_SHIELD

SMART_POWER

SMART_ARDUINO

**SMART_SHIELD , SMART_POWER,SMART_ARDUINO
(LOKII-CE board) can stacked together to provide Arduino
programming functions**

SMART_ARDUINO

To start Arduino IDE programming, user can connect the Arduino USB port to a Window / Mac computer and write programming through Arduino IDE with the LOKII Arduino library installed. Detail can be found in SMART_ARDUINO_installation.pdf

If you do not required to program in Arduino (C /C++ language), you can unplug this board before powering up the system.

Arduino USB port

For using SMART_ARDUINO for programming, please follow SMART_ARDUINO SETUP GUIDE (V1.0)

SMART_IO Extender

SMART_IO provides 17 digital I/O ports for external sensors or output in 3.3 V. This board can be replaced with SMART_ARDUINO to allow user to program in Blockly environment to control digital I/Os.

SMART_POWER

This board provide external power source and source direction detection for the LOKII-CE board. You can plug in a 6V - 8.5V DC voltage to provide up to 40W power to drive external components. For example, a list of SMART DEVICES connected through SMARTBUS and 4 x DC motor connected to the DC motor port. The default SMART_IDs for these DC port are **0,1,2,3** and cannot be changed in the program.

If you do not required to drive external devices or sound direction, you can unplug this board before powering up the system.

SMART_POWER should be plugged with external DC supply with this jack polarity.

SMART_SHIELD

This board allows SMART_POWER and SMART_ARDUINO stacked together to provide LOKII-CE AI functions. In addition, it has an internal storage (~170MB) to store multi-media files (mp3, wav, avi) for playback and configure the WIFI functions.

To power up the SMART_SHIELD, you can supply 5V DC power using USB port.

Switches 1 -5 controls LOKII-CE board boot up behaviors. When LOKII-CE boards is power up, it will check the switch conditions to kick start one of the following mode.

Switch 1 ON	LOKII-CE board enter USB mass storage mode when connect with a PC through USB cable. This allow user to change the wifi setting or copy file from mass storage.
Switch 2 ON	LOKII-CE enter SMART_ARDUINO board control mode. (This mode works if SMART_ARDUINIO is inserted before power up)
Switch 3 ON	Run Blockly script 1 once
Switch 4 ON	Run Blockly script 2 once
Switch 5 ON	Run Blockly script 3 once

Speaker port supports common 8 Ω speaker.

SMART-RC (SMART_DEVICE board)

RC_Servo board can control up to 4 RC servo motor. The default SMART_IDs for these RC port are 8,9,10,11. The initial SMART_ID (id =8) can be configured in program. The servo motor should connect according to the port pin marking (DVG)
(D = Data pin, V = Vin , G = Ground)

Some popular Servo motors supported are:

- SG90
- MG996R
- MG90S
- MG995

Programming Configuration Guide

Here is the summary for the board configuration based on the function requirements and programming method.

Function Scope	Arduino Programming	LOKII-CE Graphical IDE
LOKII-CE AI functions: <ul style="list-style-type: none">● Image processing● Sound processing● Multimedia● SMART_IOTs● Cloud AI functions	SMART_SHIELD + SMART_ARDUINO (USB power)	SMART_SHIELD + SMART_IO Extender (USB power)
LOKII-CE Smart Device Control LOKII-CE Sound direction detection	SMART_SHIELD + SMART_ARDUINO + SMART_POWER (DC jack power)	SMART_SHIELD + SMART_POWER (DC jack power)

First time setup

LOKII-CE boards support two WIFI configuration method:

- Soft-AP mode
- Station mode

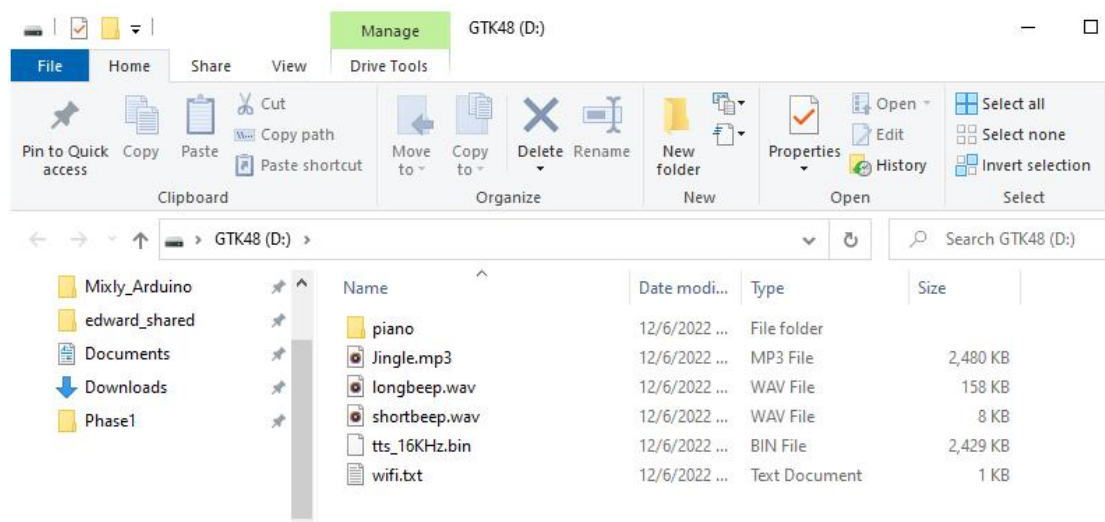

Soft-AP mode

When there is no “wifi.txt” file configured inside SMART_SHIELD USB mass storage and power up the board, LOKII_CE boards will enter Soft-AP mode. In this mode, LOKII-CE boards will emulate as a Soft-AP router (No internet connection) and user can connect this WIFI access point by joining the network name called: “**LOKII_XXXXXX**” and typing default password: “**12345678**”. After joining the network, user can use a computer device (Window/Mac/iPhone/Android) to enter “192.168.4.1” in an internet browser and enter LOKII-CE Graphical IDE.

Station mode

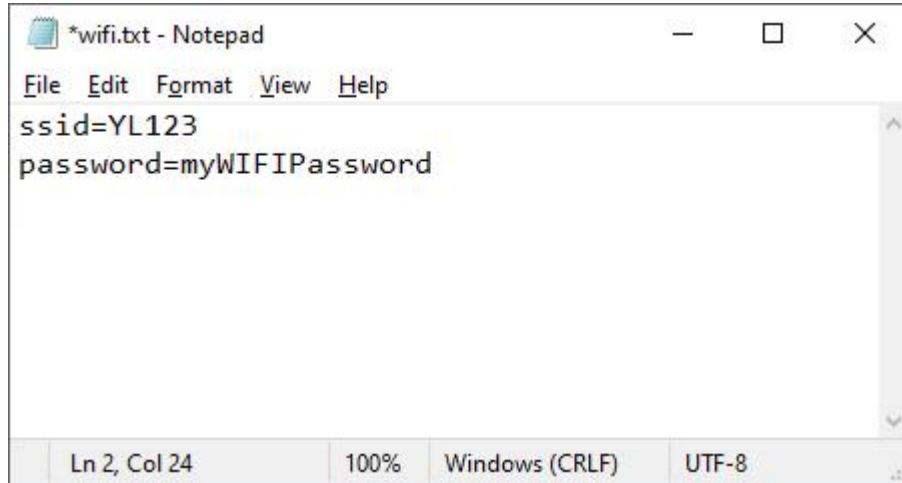

User can configure SMART_SHILED to join the same 2.4GHz WIFI router. (Not 5GHz WIFI network) In this case, user can keep the internet connection when using a computer to enter LOKII-CE Graphical IDE.

To configure Station mode, user turn on SMART_SHIELD Switch-1 for “USB mode”, and then connect the USB cable to a Window computer, SMART_SHIELD will emulate a USB mass storage device.

Under the USB mass storage drive, create a "wifi.txt" file by notepad and enter the WIFI SSID and password of the network router with following format (Make sure these keywords are in lower case) :

```
ssid=XXXXXXX  
password=XXXXXXX
```

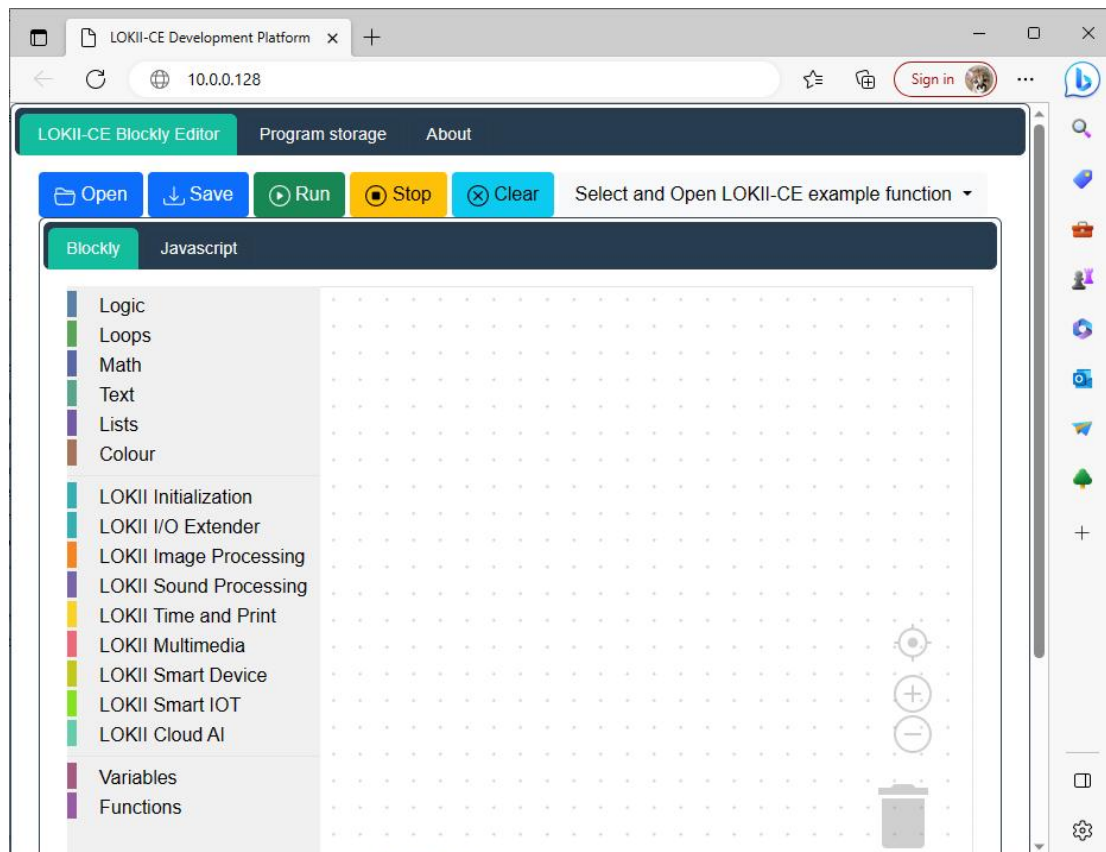

After reset the boards power (Unplug and plug in the USB power cable), LOKII-CE should show the connected IP address.

LOKII-CE Graphical IDE (Blockly)

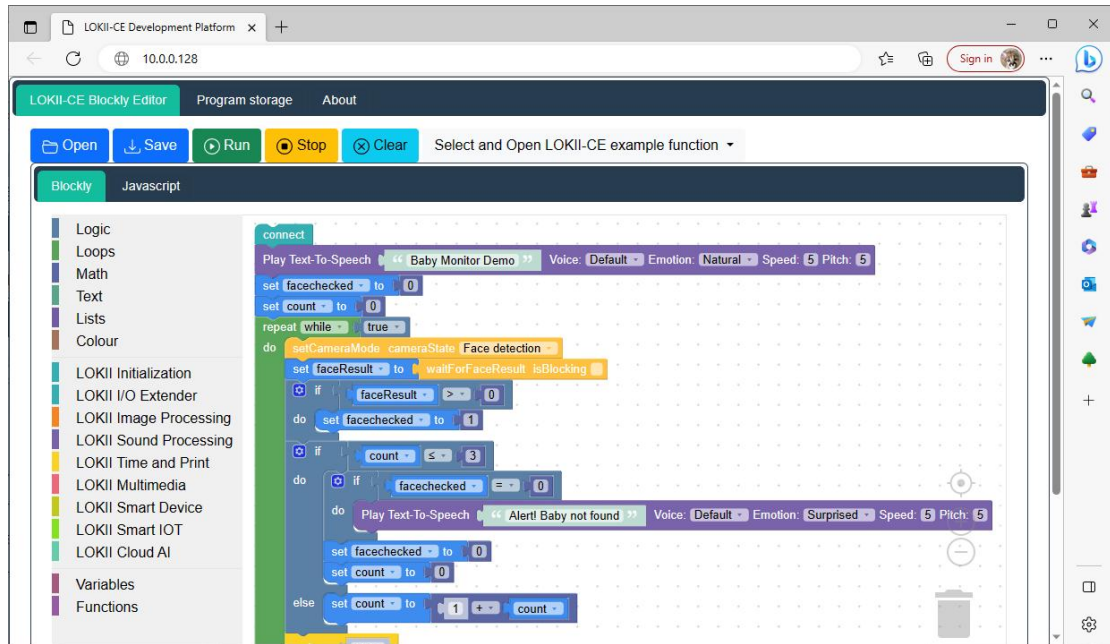

When LOKII-CE boards (without SMART_ARDUINO) power up and display the IP address, user can enter the IP address in the internet browser to start the Blockly programming. LOKII-CE Graphical IDE supports browser running on iPad / Android pad / Mac/ Linux/ Window platform.

Under LOKII-CE Blockly Editor, user can either:

- Select a sample program from the a list of demos
- Click "Open Program" to load program from PC.
- Click "Run Program" to download and run the program in LOKII-CE boards
- Click "Save Program" to save the current program into PC

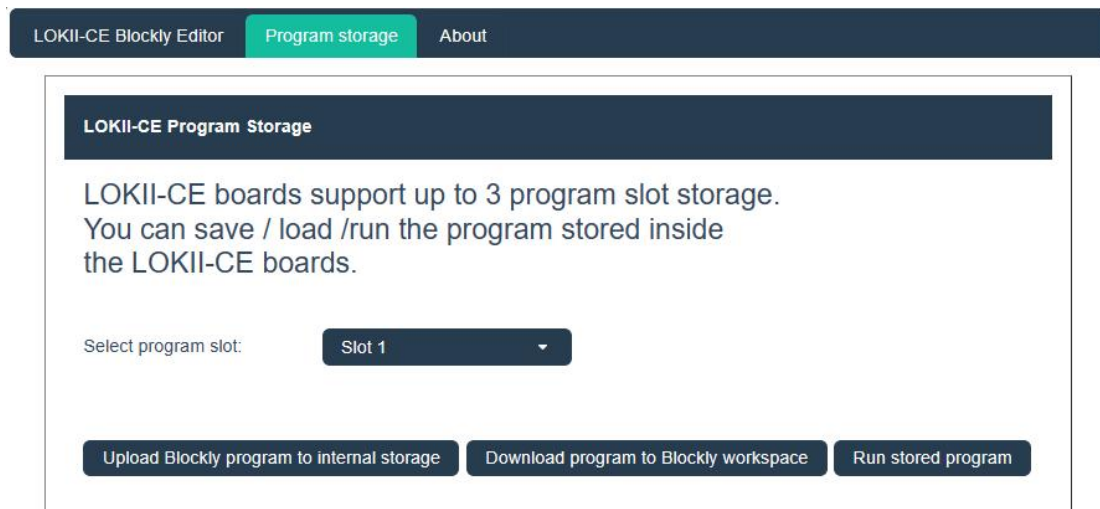

All the LOKII-CE functions can be dragged and dropped into the workspace to program logic flows:

LOKII-CE Program Storage

LOKII-CE boards support 3 Blockly scripts storage. Once user create the program in LOKII-CE Blockly Editor, user can select 1 of 3 memory slots to save /load the program from LOKII-CE boards.

The saved program can be run once automatically when LOKII-CE boards power up. For example, If SMART_SHIELD switch 3 is ON, LOKII-CE run slot 1 program during power up. If SMART_SHIELD switch 5 is ON, LOKII-CE run slot 3 program during power up.

The screenshot displays the 'LOKII-CE Blockly Editor' interface. At the top, there is a dark blue navigation bar with three tabs: 'LOKII-CE Blockly Editor', 'Program storage' (which is highlighted in a lighter blue), and 'About'. Below the navigation bar, the main content area has a dark blue header with the text 'LOKII-CE Program Storage'. The main text area contains the following text: 'LOKII-CE boards support up to 3 program slot storage. You can save / load /run the program stored inside the LOKII-CE boards.' Below this text, there is a label 'Select program slot:' followed by a dark blue dropdown menu currently showing 'Slot 1'. At the bottom of the interface, there are three dark blue buttons: 'Upload Blockly program to internal storage', 'Download program to Blockly workspace', and 'Run stored program'.

LOKII-CE About page

User can click "About" to check the LOKII-CE serial number, firmware version and undergo firmware update here.
