New Edison Lights and Energie Multisport Partner to Improve Indoor Sports Facilities and Reduce Energy Costs

Collaboration combines specialized lighting, HVAC controls and energy-management expertise for indoor sports facilities.

CHICAGO and LONGMONT, Colo. — September 14, 2026 — New Edison Lights and Energie Multisport today announced a strategic partnership to help indoor sports facilities improve playing conditions, manage energy consumption and reduce long-term operating costs.

The collaboration gives facility owners, developers, franchise organizations and multi-location operators coordinated access to the systems that directly affect building performance and customer experience.

New Edison Lights specializes in LED sports lighting, lighting controls, photometric planning, retrofits, new construction and utility rebates. Energie Multisport provides HVAC controls, building automation, energy benchmarking, utility-incentive support and energy procurement.

Each company will continue to contract for and manage its specialized scope while coordinating project planning when a facility would benefit from a broader lighting and energy-management strategy.

A More Complete Facility Strategy

Lighting and HVAC systems affect visibility, player comfort and utility expenses throughout a facility's operating day. By evaluating lighting, temperature control, occupancy patterns and equipment scheduling together, the companies can help owners prioritize practical improvements that support both the customer experience and long-term operating performance.

"Indoor sports facilities need low-glare lighting that supports player visibility while helping control long-term operating costs," said Will Walker, owner of New Edison Lights. "Working with Energie Multisport allows us to coordinate lighting and controls with a facility's broader energy and building-automation strategy. This gives owners a clearer path from initial assessment through implementation—whether they operate one facility or an expanding franchise system."

"Sports facilities rely on professionals to improve play and the customer experience. We see ourselves as the facility's energy and performance professionals," said David Anderson, president of Energie Multisport. "By bringing lighting, HVAC controls and energy strategy together, we help owners pursue lower operating costs and create a better playing environment—giving customers another reason to choose their facility."

Supporting Independent Facilities and Franchise Growth

The companies expect to collaborate on projects involving independent facilities, developers, franchise organizations and multi-location operators across pickleball, padel and other sports.

Projects may range from individual lighting or controls upgrades to coordinated facility modernization and repeatable design standards for future locations. Joint assessments, project prioritization and implementation planning will help owners evaluate potential improvements and make informed investment decisions.

For growing facility networks, the partnership provides a consistent approach to assessing existing locations, supporting new construction and standardizing lighting, controls and energy-management practices while accounting for the operational requirements of each facility.

Partnership Already Supporting Diadem Pickleball Complex

The companies' complementary approach is already being applied at Diadem Pickleball Complex as the organization expands throughout Florida.

"David and William have become our preferred lighting and HVAC providers, and that designation has been earned through performance," said Rene Prats, co-founder of Diadem Pickleball Complex. "They approach projects as partners, not simply vendors. They understand our objectives, work through challenges with us, and focus on solutions that make sense both operationally and financially."

About New Edison Lights

Founded in 2004 and based in Longmont, Colorado, New Edison Lights provides tailored LED lighting solutions for commercial, industrial and sports applications, with a particular focus on indoor pickleball and padel facilities.

Its GlareShield Pro court fixture is engineered to provide controlled, low-glare illumination and high-quality lighting for indoor play. The company's services include sports-lighting design, photometric and application support, new construction, retrofits, lighting controls and utility-rebate assistance. New Edison Lights supplies its own GlareShield Pro indoor court fixtures, along with interior and exterior general lighting packages.
