ALLIED IDENTITY

Who & What is Allied Identity

Allied Identity "AID" was formed to address the need for absolute Identity and frictionless transactions. We are distinctively positioned to fulfill the universal need of governments, businesses, and organizations to Irrefutably identify people and secure all forms of digital transactions.

AID was originally formed as a coalition of companies technically and personally linked with assets to include a formidable code base and patents. The key executives are leaders from top roles in the US Government, UN, NATO and leading companies in the Healthcare, Identity and Credential markets, with proven results. This depth of experience and corresponding industry contacts,

Integrated Data Management

gives us and our customers unparalleled opportunities to solve problems from the top down with the application of cutting edge mobile and big data technology that works in conjunction with prior investments. We do this by listening carefully to the issues on the ground. AID's focus markets are Government, Healthcare, and Financial transactions. We also apply the same focus to Build, Operate, and Transfer / JV programs as required by governments for projects such as Passports and Identity Card Production.

The company has developed a unique value chain and platform that uniquely solve common, critical shortcomings of existing solutions. With an expert mix of patented technologies, worldwide partnerships, and considerable experience,

AID is preparing for the next step in identity management and its accelerated success.

We Make Governments Smarter

BUILDING UNIQUE VALUE CHAINS THAT SOLVES 21ST CENTURY PROBLEMS

The three pillars of any government is to protect its citizens (security), collect revenue (taxation), and distribute benefits (pensions & healthcare). Allied Identity's Government product suites addresses two of these three pillars. With the slow growth of many economies today, governments are making major administrative changes to adapt. The development of e-Government with online services, and the desire to reduce budgets has driven an interest in converged strong identity credentials as one of the major areas for increased efficiencies and for the reduction of costs. By implementing a smart converged ID credential, governments can reduce real

costs by eliminating multiple silos of duplicated functions within their own departments /ministries. By deploying strong solution sets using biometrics and smart cards, most government digital Identity systems are more than paying for themselves. Smart cards with strong identity infrastructures are major drivers in a digital society and are required to enable **security** in transactions with e-government ecosystems. Strong identity systems eliminate "ghost workers", improve employee time tracking, and increase the tax base through the elimination of cash in transactions. In some countries **healthcare and benefit distributions** make up more than 20% of a national budget. Allied Identity's Biopay Kiosks and Point of Sales Terminals with Biometric enhancements-

Biopay Kiosk for Visa on Arrival payments and issuance for airports

capture and compare technologies are major enablers for a robust digital economy.

ABSOLUTE IDENTITY

Providing Real Identity for all people involved in government programs.

BENEFITS DISTRIBUTION

Facilitating efficient and cost-effective distribution of assets

HEALTHCARE IMPROVEMENT

Control of healthcare costs and outcomes through improved transaction validation, patient communication, workflows and connectivity across all data domains

EMERGENCY RESPONSE

Delivering improved emergency and incident response and management tools

ASSET MANAGEMENT

Enabling intelligent accountability of government assets
