WIRELESS LOCKS

GD ENTRY SYSTEMS

GD Entry integrates with the Yale Assure lock family providing seamless integration into the GD Entry Access Control System by simply swapping the communications module. This provides a unified solution to managing an entire building without the hassle of operating multiple systems. The best part is, NO REOCCURRING COST!

Seamlessly update existing locks or deploy new locks. GD Entry's locks will talk to one another on a secure mesh network created by each lock, only requiring one POE-powered gateway to be connected to the access control server. This means many locks can connect to one gateway, without being within wireless range of that gateway.

Add on the RF package to seamlessly integrate a Prox, Smartcard, or Blue-tooth (Future) reader to each wireless lock for added use!

Features

- Current support is ZWave with WiFi, Bluetooth, and Zigbee support coming later 2020

- Stores up to 25 codes on the lock including the master pin

- Logs all activity on the lock and uploads to the server daily

- Control lock from the GD Entry Access Control Server to open remotely, lock remotely, or update codes/cards

- Set time of day and restricted access for codes and cards on each lock, restricting access for maintenance and third-party services

- Easy deployment! Install the chip, note the MAC, associate that MAC to a door in the access control, set the master PIN, and the lock is commissioned in minutes

- Low battery notification so you know before there is an issue to change the battery

- Lock operation for at least a year without changing the batteries

- Future integration to the GD Entry Access Control app coming for Virtual Credentials
