- DERMATOPATHOLOGY QUIZ

# CASES 64-76

Soheil S. Dadras MD-PhD

Case 64. 14M Left flank, suspect foreign body.  
What is your diagnosis?

---

A. Osteoma cutis

---

B. Osteochondroma

---

C. Osteoma

---

D. Osteosarcoma

---

E. Chondrosarcoma with osseous differentiation

Case 64. 14M Left flank, suspect foreign body.  
What is your diagnosis?

---

A. Osteoma cutis

---

B. Osteochondroma

---

C. Osteoma

---

D. Osteosarcoma

---

E. Chondrosarcoma with osseous differentiation

Case 65. 20F Left Plantar Foot, Wart.  
What is your diagnosis?

---

A. Osteoma cutis

---

B. Osteochondroma

---

C. Osteoma

---

D. Osteosarcoma

---

E. Chondrosarcoma with osseous differentiation

Case 65. 20F Left Plantar Foot, Wart.  
What is your diagnosis?

---

A. Osteoma cutis

---

B. Osteochondroma

---

C. Osteoma

---

D. Osteosarcoma

---

E. Chondrosarcoma with osseous differentiation

Case 66. 60M, Right Upper Arm Excision. Mass.  
What is your diagnosis?

---

A. Myxolipoma

---

B. Pleomorphic lipoma

---

C. Spindle cell lipoma

---

D. Lipoblastoma

---

E. Well-differentiated Liposarcoma/Atypical lipomatous tumor

Case 66. 60M, Right Upper Arm Excision. Mass.  
What is your diagnosis?

---

A. Myxolipoma

---

B. Pleomorphic lipoma

---

C. Spindle cell lipoma

---

D. Lipoblastoma

---

E. Well-differentiated Liposarcoma/Atypical lipomatous tumor

Case 67. 47M, Abdominal wall cyst excision.  
What is your diagnosis?

---

A. Pilar leiomyoma

---

B. Vascular leiomyoma (angiomyoma, angioleiomyoma)

---

C. Hemangioma

---

D. Congenital smooth muscle hamartoma

---

E. Leiomyosarcoma

Case 67. 47M, Abdominal wall cyst excision.  
What is your diagnosis?

---

A. Pilar leiomyoma

---

B. Vascular leiomyoma (angiomyoma, angioleiomyoma)

---

C. Hemangioma

---

D. Congenital smooth muscle hamartoma

---

E. Leiomyosarcoma

Case 68. 55F, Left Shoulder Excision. Mass.  
What is your diagnosis?

---

A. Myxolipoma

---

B. Pleomorphic lipoma

---

C. Spindle cell lipoma

---

D. Lipoblastoma

---

E. Well-differentiated Liposarcoma/Atypical lipomatous tumor

Case 68. 55F, Left Shoulder Excision. Mass.  
What is your diagnosis?

---

A. Myxolipoma

---

B. Pleomorphic lipoma

---

C. Spindle cell lipoma

---

D. Lipoblastoma

---

E. Well-differentiated Liposarcoma/Atypical lipomatous tumor

Case 69. 55F, Left Shoulder Excision. Mass (same lesion). What are the two immunohistochemical markers to confirm the diagnosis?

---

A. MDM2; CKD4

---

B. MDM2; CDK4/6

---

C. p53; CDK2

---

D. p53; CDK4

---

E. p16; CDK4/6

Case 69. 55F, Left Shoulder Excision. Mass (same lesion). What are the two immunohistochemical markers to confirm the diagnosis?

---

A. MDM2; CKD4

---

B. MDM2; CDK4/6

---

C. p53; CDK2

---

D. p53; CDK4

---

E. p16; CDK4/6

**MDM2**

**CDK4**

What is the key genetic abnormality in well-differentiated liposarcoma (WDLS) / atypical lipomatous tumor (ALT)?

**Amplification of the 12q14-15 region**, which includes:

- ***MDM2*** (primary driver gene)
- ***CDK4*** (frequently co-amplified)
- Other genes in the region (e.g., *HMGA2*, *DDIT3*)

**Diagnostic Confirmation Methods:**

1. **FISH (Fluorescence In Situ Hybridization)** – Gold standard for detecting *MDM2* amplification.
2. **Molecular Testing (e.g., SNP array, NGS)** – Can identify 12q14-15 amplification.
3. **IHC (Immunohistochemistry)** – *MDM2* and *CDK4* nuclear positivity (supportive but less specific than FISH).

**Why This Matters:**

- Distinguishes WDLS from benign lipomas (which lack *MDM2* amplification).
- Helps differentiate from other liposarcoma subtypes (e.g., dedifferentiated liposarcoma also has *MDM2* amplification, while myxoid/round cell liposarcoma has *FUS-DDIT3* or *EWSR1-DDIT3* fusions).

Case 70. 79F, Right Breast Biopsy. 1.3 x 0.5 cm; concerning for inflammatory breast carcinoma. What is your diagnosis?

---

A. Pilar leiomyoma

---

B. Vascular leiomyoma (angiomyoma, angioleiomyoma)

---

C. Hemangioma

---

D. Congenital smooth muscle hamartoma

---

E. Leiomyosarcoma

Case 70. 79F, Right Breast Biopsy. 1.3 x 0.5 cm; concerning for inflammatory breast carcinoma. What is your diagnosis?

---

A. Pilar leiomyoma

---

B. Vascular leiomyoma (angiomyoma, angioleiomyoma)

---

C. Hemangioma

---

D. Congenital smooth muscle hamartoma

---

E. Leiomyosarcoma

Case 71. 65F, Right Knee Biopsy. R/O EIC vs. DF.  
What is your diagnosis?

---

A. Vascular leiomyoma

---

B. Leiomyosarcoma

---

C. Atypical chondroma

---

D. Cutaneous mixed tumor

---

E. Cutaneous chondroma

Case 71. 65F, Right Knee Biopsy. R/O EIC vs. DF.  
What is your diagnosis?

---

A. Vascular leiomyoma

---

B. Leiomyosarcoma

---

C. Atypical chondroma

---

D. Cutaneous mixed tumor

---

E. Cutaneous chondroma

Case 72. 55M, Left Upper Lip Excision; neoplasm of uncertain behavior. What is your diagnosis?

---

A. Pleomorphic adenoma

---

B. Eccrine hidradenoma

---

C. Atypical chondroma

---

D. Cutaneous mixed tumor

---

E. Cutaneous chondroma

Case 72. 55M, Left Upper Lip Excision; neoplasm of uncertain behavior. What is your diagnosis?

---

A. Pleomorphic adenoma

---

B. Eccrine hidradenoma

---

C. Atypical chondroma

---

D. Cutaneous mixed tumor

---

E. Cutaneous chondroma

Case 73. 64M, Left Lateral Malleolus Ankle;  
Nodule, R/O pilar cyst vs. myxoid cyst.  
What is your diagnosis?

---

A. Pilar leiomyoma

---

B. Vascular leiomyoma (angiomyoma, angioleiomyoma)

---

C. Hemangioma

---

D. Congenital smooth muscle hamartoma

---

E. Leiomyosarcoma

Case 73. 64M, Left Lateral Malleolus Ankle;  
Nodule, R/O pilar cyst vs. myxoid cyst.  
What is your diagnosis?

---

A. Pilar leiomyoma

---

B. Vascular leiomyoma (angiomyoma, angioleiomyoma)

---

C. Hemangioma

---

D. Congenital smooth muscle hamartoma

---

E. Leiomyosarcoma

Case 74. 60M, Mid Back Excision; mass 5.0 x 3.0 x 2.0 cm. What is your diagnosis?

---

A. Granular cell tumor

---

B. Hibernoma and lipoma hybrid

---

C. Spindle cell lipoma

---

D. Lipoblastoma

---

E. Well-differentiated Liposarcoma/Atypical lipomatous tumor

Case 74. 60M, Mid Back Excision; mass 5.0 x 3.0 x 2.0 cm. What is your diagnosis?

---

A. Granular cell tumor

---

B. Hibernoma and lipoma hybrid

---

C. Spindle cell lipoma

---

D. Lipoblastoma

---

E. Well-differentiated Liposarcoma/Atypical lipomatous tumor

MIB-1

Case 75. 63M, Left Upper Arm Excision; 8-mm dense, tender mass. What is your diagnosis?

---

A. Pilar leiomyoma

---

B. Cellular dermatofibroma

---

C. Dermatofibrosarcoma protuberans

---

D. Atypical intradermal smooth muscle neoplasm

---

E. Cutaneous leiomyosarcoma

Case 75. 63M, Left Upper Arm Excision; 8-mm dense, tender mass. What is your diagnosis?

---

A. Pilar leiomyoma

---

B. Cellular dermatofibroma

---

C. Dermatofibrosarcoma protuberans

---

D. Atypical intradermal smooth muscle neoplasm

---

E. Cutaneous leiomyosarcoma

Case 76. What are two widely used IHC markers to verify smooth muscle differentiation?

---

A. S100, Smooth muscle actin (SMA)

---

B. S100, Smooth muscle myosin heavy chain (SMMHC)

---

C. S100, Desmin

---

D. Desmin, Smooth muscle myosin heavy chain (SMMHC)

---

E. Desmin, Myogenin

Case 76. What are two widely used IHC markers to verify smooth muscle differentiation?

---

A. S100, Smooth muscle actin (SMA)

---

B. S100, Smooth muscle myosin heavy chain (SMMHC)

---

C. S100, Desmin

---

D. Desmin, Smooth muscle myosin heavy chain (SMMHC)

---

E. Desmin, Myogenin

Desmin

Smooth muscle myosin heavy chain

# The two most specific immunohistochemical (IHC) markers for smooth muscle differentiation are:

## \*\*1. Smooth Muscle Myosin Heavy Chain (SMMHC, MYH11)

- **Highly specific** for smooth muscle cells.
- More specific than **SMA (Smooth Muscle Actin)**, which can also label myofibroblasts and pericytes.
- Expressed in **vascular smooth muscle, myometrium, and leiomyomas/leiomyosarcomas**.

## \*\*2. Caldesmon (h-Caldesmon, the high-molecular-weight isoform)

- **Specific for smooth muscle and myoepithelial cells**.
- Helps distinguish true smooth muscle tumors (e.g., leiomyoma/leiomyosarcoma) from myofibroblastic proliferations (which are typically **SMA+ but h-Caldesmon-**).

## Additional Useful (But Less Specific) Markers:

- **Smooth Muscle Actin (SMA)** – Sensitive but not entirely specific (also positive in myofibroblasts).
- **Desmin** – Often co-expressed but also seen in skeletal muscle and some myofibroblastic tumors.

## Best Practice:

- For **definitive smooth muscle differentiation**, use **SMMHC + h-Caldesmon** as the most specific combination, supplemented by **SMA** and **desmin** for sensitivity.
