

Your home. Your water. Your health.

Buying a home is a significant investment in your financial future, as well as your health and well-being. Ensure the water you will be drinking is safe.

Drinking water contamination from piping may be exposing you to harmful chemicals that you can't see, taste, or smell.

Safeguard yourself and your future. Test with Tap Score.

Well Tests

If your water comes from a private well, we recommend testing for groundwater contaminants with our VA/FHA-compliant test packages.

Well Basic

Tests bacterial growth, naturally occurring arsenic, lead from old pipes, as well as nitrates and nitrites from nearby surface runoff.

Well Pro

A more comprehensive testing package including a broad range of 50+ parameters (heavy metals, hardness, mineral content and more).

City Tests

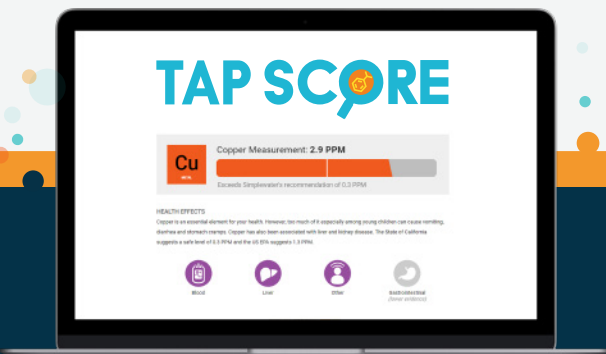

If your water comes from the local utility, it's likely disinfected with chlorine to prevent bacterial contamination. Meanwhile, about 25% of US homes test positive for lead, copper, and other plumbing related toxins.

City Basic

Analyzes 10 of the most common piping contaminants—such as lead, iron, and nickel—along with general properties like pH.

City Pro

This 45+ parameter test analyzes the most common water quality hazards from aging distribution lines and your own home's plumbing.

Tap Score Water Reports

Our tests come with more than just results. Tap Score reports give you in-depth analysis with actionable recommendations.
