

# A cost-effective way to bring your golf course irrigation pumping system up to date without investing in all new equipment.

## No need to invest in a brand-new irrigation pumping system.

By upgrading your existing pumping system control panel, you can make considerable savings on bringing your old system up to date. By removing the control panels internal equipment and integrating our new control equipment into your old system you can have a fully modernized watering system in a matter of hours.

You can also add mobile phone technology to control and monitor your system remotely.

Here at S T Controls, we have replaced the golf course watering control systems on three major golf courses recently, each job only took one overnight visit each by our engineers with no disruption to the normal running of the maintenance of the course.

**Archerfield Links GC** in Scotland was the first club to get the renovation from a 6-foot tall over complicated nightmare to our compact very easy to use system.

[Archerfield Links - This is Archerfield Links \(archerfieldgolfclub.com\)](http://archerfieldgolfclub.com)

Scarborough was the next destination **Ganton GC**. over the course of one overnight visit, we completely rebuilt the old faulty 3 pump controls and made it into a fully modernised easy to use variable speed drive system. By adding ventilation to the existing control panel enclosure, we mounted all the new equipment inside along with a mobile phone GSM system to enable the watering system to be monitored and started remotely.
