

Circular Solar Announces Officially Onboarding With Puro.earth For Engineered 1,000-Year Durable Carbon Removals For Circular Solar Nanorock Farms

August 4th, 2026

“Today, August 4th, I am thrilled to announce that Circular Solar has officially begun onboarding with Puro.earth for engineered, 1,000-year durable carbon removals (CDR) for our Circular Solar Nanorock farms. This is a high-impact project that combines clean power generation, carbon removal with high-quality, circular infrastructure made from recycled materials. This decision is 24 years in the making, starting from my early work in innovating and trying to commercialize advanced metal-oxide thin-film coatings.

From the start, my vision has been to use this technology for solar, divert materials from landfills, create new jobs, and to help solve larger environmental and infrastructure challenges. The concrete waste in my hand symbolizes what we intend to do with rubble and construction debris — turning it into more productive infrastructure and Nanorocks which supports both energy production and durable carbon removal. I look forward to sharing more updates soon, as we try to help solve some complex-challenges with Circular Solar Nanorock farms. Thank you!"
