

## **Breast Cancer**

**Breast cancer is the second most common cancer among American women, only behind skin cancer. About 250,000 women in the United States are diagnosed each year.**

**Breast cancer can develop from cells in either the ducts or lobes, but ductal tumors are more common. The cells acquire mutations that cause them to divide too rapidly or survive too long.**

**As breast cells acquire more mutations, they begin to look less normal under a microscope. They can divide quickly and are less likely to die when normal cells would. Over time, they form a mass or tumor.**

**Women with a family history of breast cancer are at increased risk. Having a first-degree relative diagnosed with breast cancer can increase the risk two- to four-fold.**

Breast cancer is a type of cancer that forms in the breast cells. It is the most common cancer in women worldwide, although it can also affect men. Breast cancer usually originates in the milk ducts or lobules of the breast.

**Causes and Risk Factors:** The exact causes of breast cancer are not fully understood, but certain factors can increase the risk of developing the disease. These risk factors include:

1. **Gender and age:** Being a woman and advancing age are the primary risk factors for breast cancer. The risk increases as a person gets older.
2. **Family history and genetics:** Having a close family member (such as a mother, sister, or daughter) who has had breast cancer, especially at a young age, increases the risk. Certain gene mutations, such as BRCA1 and BRCA2, are also associated with an increased risk of breast cancer.
3. **Personal history of breast cancer or certain non-cancerous breast conditions.**
4. **Hormonal factors:** Prolonged exposure to estrogen, such as starting menstruation at an early age, late menopause, or using hormone replacement therapy, can increase the risk.
5. **Lifestyle factors:** Factors like excessive alcohol consumption, obesity, lack of physical activity, and a diet high in saturated fats have been associated with an increased risk of breast cancer.

**Signs and Symptoms:** Common signs and symptoms of breast cancer may include:

1. A new lump or mass in the breast or underarm area.
2. Breast pain or discomfort.

3. Changes in breast size, shape, or appearance.
4. Nipple changes, such as nipple inversion, discharge, or scaling.
5. Skin changes, including redness, dimpling, or puckering.

It is important to note that some breast cancers may not cause any symptoms, which is why regular breast self-exams, clinical breast exams, and mammograms are crucial for early detection.

Diagnosis and Treatment: Early detection and prompt treatment are vital for better outcomes in breast cancer. The diagnostic process may involve:

1. Breast imaging: Mammography, ultrasound, and magnetic resonance imaging (MRI) may be used to visualize and evaluate breast abnormalities.
2. Biopsy: A sample of breast tissue is taken for laboratory analysis to determine if cancer is present and to identify the specific type.

Treatment options for breast cancer depend on factors such as the stage of cancer, the specific type of breast cancer, hormone receptor status, and the individual's overall health. The main treatment modalities include:

1. Surgery: HHH Therapy options include natural and holistic approaches or a lumpectomy (removal of the tumor and surrounding tissue) or mastectomy (removal of the entire breast). Lymph node removal may also be performed to determine if the cancer has spread.
2. HHH Therapy: Natural and Holistic approaches or High-energy radiation is used to kill cancer cells or reduce the risk of recurrence. It is typically given after surgery to destroy any remaining cancer cells.
3. HHH Therapy or Chemotherapy: Natural and Holistic or Anti-cancer drugs are administered orally or intravenously to kill cancer cells throughout the body. Chemotherapy may be given before surgery (neoadjuvant) to shrink tumors or after surgery (adjuvant) to destroy any remaining cancer cells.
4. HHH Therapy or Hormone therapy: If the breast cancer is hormone receptor-positive, HHH Therapy or hormone-blocking medications (such as tamoxifen or aromatase inhibitors) may be used to prevent the growth and spread of cancer cells.
5. Targeted therapy: This treatment approach uses vitamins and therapies or drugs that specifically target certain molecules or genetic changes in cancer cells. For example, HER2-positive breast cancers may be treated with targeted therapies like trastuzumab.

The treatment plan is personalized for each individual based on various factors, and a multidisciplinary team of healthcare professionals, including surgeons, medical oncologists, radiation oncologists, and other specialists.

**Step 1: The Holistic Assessment**

“The allopathic approach to Natural Therapy or chemotherapy often destroys the body’s own natural ability to attack cancer cells, damaging the immune system and leaving it defenseless against the disease. Our alternative-natural cancer treatment heals the body to maximize its own ability to attack cancer cells and has been studied to increase success rates up to 80% by combining 5 etiological areas: Genetics, Nutrition, Xenobiosis, Chronic Inflammation and psychology” – Google Search.

Understanding the patient’s needs to design the best strategy against cancer  
The Holistic Assessment is our first step, where our multidisciplinary team composed of oncologists, surgeons, nutritionists and holistic medicine experts tailor the treatment based on the individual needs and medical history of the patient. The medical team will address the patient’s concerns, assess their health and determine a nutrition plan.

**Stage 2 (ongoing): Cellular Nutrition**

Gerson and Keto nutrition principles to nourish the body to maximize the treatment. Cellular Nutrition is an ongoing stage that is designed to make the patient’s body stronger and healthier so that it can better endure treatment and minimize side-effects. When a body is not getting the sufficient nutrients it needs, a chronic disease such as cancer can grow faster and spread more quickly. Our nutrition program is founded on Gerson therapy and Ketogenic Diet principles that will be tailored to the individual patient based on their medical history, cancer stage and nutrition deficiencies.

**Stage 3: Detoxification**

Relieving the body of toxic waste for optimal health

The Detoxification process begins following the initial assessment and is a key element to the management of any type of chronic degenerative disease including cancer. Cancer develops at our body's cellular level. When a patient is suffering from this disease you can find large amounts of toxins such as: waste, dead cells and pro-inflammatory agents, among others. Once the disease starts to spread, the body will not be able to eliminate these toxins. Our detoxification process employs nutritional and metabolic manipulation of the liver, digestive system, urinary organs and skin to enhance their ability to better eliminate toxins and keep the body at optimal condition.

**Stage 4: Immune Support And Regulation**

Reliving the body from chronic inflammation with natural therapies

Our immune system support and regulation therapies play a critical role in the fight against cancer, here we relieve the body from chronic inflammation that deprive the body's defense system and prevent it from fighting back the cancer.

Our team employs the use of proven immune system support therapies that include Japanese Fungi, Chinese Herbs, Green Tea Extract, Turmeric or Curcumin, Essential Fatty Acids in High Doses, Probiotics, Vitamin D among other, to avoid use of conventional drugs that can cause more harm and have negative side-effects.

**Stage 5: Cancer Suppression**

Our Anti-Cancer Strategy to Eliminate Cancer

Our cancer suppression strategy employs the combination of proven therapeutic cancer treatments that have been scientifically tested to reverse the effects of cancer or to completely remove the cancer.

**Stage 6: Follow-up and support**

In order to keep our patients in remission, we provide complete follow-up packages and care for three years after treatment. We are in constant communication with our patients, offering advice, home treatments, telemedicine, Pharma Therapy, telepharma and support.

## **ALTERNATIVE BREAST CANCER TREATMENT**

Approximately **13% of women develop breast cancer**, and the condition affects more than 200,000 women each year. In total, more than 3 million women have been diagnosed with breast cancer at some point in their lives. Family history does play a role in determining your risk for breast cancer, yet it is mostly related to the natural aging process. The nature of breast cancer is such that it may spread to your lymph nodes and other tissues, and this is why oncologists recommend treatment. Homeopathy is widely used to treat different types of cancer, and it is one of the best natural cures for breast cancer. Holistic breast cancer treatments allow people to avoid much of the pain and suffering associated with conventional chemo and radiation therapy. Our team knows how to beat breast cancer. We prepare a homeopathic remedy from your pathology slides and recommend the specific remedy to ensure that your breast cancer is cured naturally. Alternative breast cancer treatments for breast cancer are aimed at improving the immune system and helping the body combat cancer. Holistic breast cancer treatment the natural way involves using herbal, natural, and homeopathic remedies to deal with the disease. Using natural remedies for breast cancer that trigger the immune system and taking advantage of remedies that can help fight cancer is becoming a new trend. More and more patients rely on using alternative breast cancer treatments to lead healthy lives.

## **TRADITIONAL TREATMENTS FOR BREAST CANCER**

There is often a gap in the breadth and depth of knowledge about breast cancer, including possible treatments. Studies using standardized questionnaires indicate that almost **half of women have experienced at least one symptom of cancer, and almost 10% report symptoms in their breasts**. Many do not discuss their concerns with their primary care providers, and those who do often leave the appointment believing that the only three treatment options are chemotherapy, mastectomy without chemo, or a combination of chemo and mastectomy. The effects of these approaches on a woman's quality of life make key medical decisions very difficult.

## **START THE FIGHT WITH BREAST CANCER**

Most people are so paralyzed by the diagnosis that they can't get their thoughts together. Meanwhile, it's imperative to start acting as soon as possible. The right

approach to breast cancer homeopathic remedies can make a difference between a healthy life and years filled with struggles.

## WHY SHOULD YOU CONSIDER ALTERNATIVE BREAST CANCER TREATMENTS?

At Cancer Foundation, our experts have a proven track record with **complementary and alternative medicine (CAM) for breast cancer**. Our approach is based upon an individualized plan of care that includes lifestyle changes, natural supplements, holistic treatment, and home remedies. Alternative breast cancer treatments, along with careful monitoring and coordination with your oncologist, is why we have successfully helped so many women who are looking for inflammatory breast cancer alternate treatment options.

## WHAT IS HOLISTIC BREAST CANCER TREATMENT?

Holistic breast cancer treatment includes the standard medications prescribed by an oncologist, but the doses are reduced by 90%. This measure alone is ineffective for treating breast cancer, but it works very well when you take the doses when your blood sugar levels are low. We lower your blood glucose with insulin to achieve the ideal physiological conditions that are needed to naturally treat your breast cancer. Doing so sensitizes the breast cancer cells that rely on glucose for their metabolism. This allows us to target these cells with very small doses of chemotherapy, avoiding the harsh side effects and immune suppression associated with conventional chemotherapy. This process, known as **Insulin Potentiated Therapy (IPT)**, along with a variety of complementary treatments to boost the immune system, allows your body to fight breast cancer.

## COMBINING ALTERNATIVE TREATMENT FOR BREAST CANCER AND TRADITIONAL TREATMENTS

Combining alternative treatments for breast cancer and traditional methods is an increasingly popular and effective way to treat the disease. Many individuals have found that combining unfamiliar treatment options, such as medicinal mushrooms or massage, with conventional treatments like surgery or radiation offers greater success in relieving symptoms and reducing risk of reoccurrence. Further, patients are beginning to report a more holistic experience when treating their body as a whole rather than simply focusing on traditional solutions. This combination approach can be customized depending on the individual's unique needs and lifestyle, giving them ownership over their wellness journey. As such, alternative treatments may be a beneficial avenue for those seeking out additional remedies during their treatment process and recovery.

## WHAT DOES ALTERNATIVE TREATMENT FOR BREAST CANCER INCLUDE?

Finding an appropriate alternative therapy that works best for you will depend on your lifestyle choices and desires. It's also important to follow your doctor's advice concerning any possible side effects from taking alternative treatments alongside conventional therapies. With a variety of options available nowadays, it is easy for individuals to tailor a unique treatment plan that can provide hope and comfort during these difficult times.

## **COMPLEMENTARY THERAPIES**

Based on your individual needs, we select a combination of treatments that offers the best possible outcomes for naturally treating your breast cancer.

## **NUTRITION**

A woman with breast cancer must start by altering her diet, but not at the expense of losing weight. Weight loss weakens the immune system. Foods should not be high in sugar or carbohydrates. Specialists from the alternative breast cancer treatment center Cancer Foundation assist patients with designing a personalized diet to fight their particular cancer. The right nutrition plan boosts the immune system and allows the body to fight the disease. Proper nutrition affects every area of your life, and it becomes even more important when you are fighting breast cancer, whether you are using traditional methods of treatment or pursuing breast cancer CAM. At alternative breast cancer treatment center Cancer, our nutrition experts work with you to identify dietary changes that help boost your immune system while slowing down cancer cells. At the centerpiece of this approach is the goal of starving cancer cells of the nutrients they need. Specifically, boost your intake of vegetables, plant-based foods, and fruits. Your diet should minimize or eliminate foods that are:

- Cured with salt
- High in fat
- Pickled or smoked

Defining a proper breast cancer diet on your own probably feels overwhelming, and the experts at HHH are here to help. Our knowledge, expertise, and experience with breast cancer nutrition simplify the process, and we stand by you every step of the way. In addition to the overwhelming number of considerations for a breast cancer diet, you also have to consider any chronic health conditions that you have, such as obesity, diabetes, high blood pressure, glucose intolerance, and thyroid issues. Changing your diet without balancing the specific requirements of these medical conditions may affect your immune system, energy levels, and metabolism. We understand how to balance all of your health needs.

## **NATURAL ALTERNATIVES TO TAMOXIFEN**

Tamoxifen is a prescription medication that is used to reduce recurrences of breast cancer. Many women who want holistic treatment of breast cancer want a natural alternative due to the side effects and risks of the medication. If you are taking tamoxifen, our team can recommend breast cancer complementary therapies that may reduce your dependence on the medication.

## **EXERCISE**

In addition, exercising increases oxygenation relieves stress, and fatigue, and brings the body more into balance. Regular moderate exercise improves sleep and quality of life. Exercise should become an integral part of a patient's life regardless of other treatments.

## **MINDFULNESS DURING BREAST CANCER TREATMENT**

Living with breast cancer heightens anxiety, not only because of the diagnosis, but also the increased focus on your health. Anxiety and stress are known to impact your immune system and may lead to other health complications, such as high blood pressure. Mindfulness practices, such as meditation, yoga, tai chi, music and art therapy, and aromatherapy, help you maintain a healthy balance. Meditation is another tool many patients can use effectively. By learning how to relax the mind and body, a patient allows the organism to focus on more important thoughts, instead of being preoccupied supporting a stressful environment. Meditation is an effective way to improve a positive outlook and reduce stress. The biggest challenge with mindfulness practices is making time for yourself. It is hard enough under normal circumstances, and you may be tempted to invest energy elsewhere. At Cancer Foundation, we help you focus on self-care to ensure that you can fight breast cancer naturally.

## **MASSAGE THERAPY AND ACUPUNCTURE**

Massage therapy and acupuncture are two powerful techniques for self-care, and studies have shown both to be beneficial to your overall health. Massage therapy and acupuncture reduce fatigue, anxiety, and discomfort while boosting the immune system. Both techniques are also known as lymph nodes natural treatment to keep your immune system working efficiently and effectively. These practices are also known to increase white blood cell levels in women who have stage 1 and stage 2 breast cancer. To optimize the benefits of massage therapy and acupuncture, choose a therapist who is trained in the best techniques for breast cancer patients.

## **BIOFEEDBACK**

Biofeedback is an effective technique for healing breast cancer naturally while going through chemotherapy. The practice helps with side effects as you learn how to control involuntary functions in your body. With practice, biofeedback helps you regulate your heart rate, relax tense muscles, and keep your blood pressure within normal limits. The popularity of biofeedback to heal breast cancer naturally has resulted in many devices being released into the market that are not properly tested or regulated. Our expert team helps you find the best techniques and devices so you can safely incorporate biofeedback into your breast cancer complementary and alternative therapies.

### **INSULIN POTENTIATION THERAPY (IPT)**

**IPT** has revolutionized cancer treatment by exploiting a common trait of malignant cells; their insatiable appetite for sugar. By injecting insulin, the body is tricked into producing an influx of glucose that draws in and opens up breast cancer cells – making them vulnerable to further attack from reduced doses of traditional chemotherapies. This technique allows treatments to be specifically tailored towards targeting only affected areas without harming healthy tissue - resulting in greater accuracy and improved outcomes compared with more general approaches.

### **HYPERTHERMIA**

**Hyperthermia** has been a game changer in the fight against breast cancer. Through this therapeutic application of heat, treatments such as low-dose chemotherapy are supercharged to amazing effect: tumor size reduction, pain relief and improved neurological conditions have all become within reach without invasive and potentially harmful surgeries or drugs. This ancient practice is now at the cutting edge of modern medicine!

### **WHAT ELSE YOU SHOULD KNOW ABOUT ALTERNATIVE BREAST CANCER TREATMENTS**

In addition to nutrition, supplements are known to help beat breast cancer naturally. Antioxidants are common practice for CAM, and certain micronutrients are known to reduce damage to healthy cells. Ideally, you should get these micronutrients from your food, but you can use supplements. We recommend that you increase your intake of beta carotene, vitamin E, lycopene, vitamin C, and vitamin A. Foods that are high in these micronutrients include vegetables, cereals, and fruits. Some of the best antioxidant foods include pecans, wild blueberries, goji berries, dark chocolate, and kidney beans. Some foods work as natural chemotherapy in the body, and we include alternatives to chemotherapy for breast cancer in your treatment plan. We also recommend certain herbs for holistic breast cancer treatment. As with other supplements, you need to use high-quality, organic herbs in the right combination to

achieve the best possible results. As part of our holistic approach to breast cancer treatment, you meet with a certified herbalist who prepares the breast cancer herbs for you and explains how to use them. If you decide to take oral supplements, it's important that you choose ones that are organic and all-natural. Many supplements have additives that are counterproductive to the health benefits. Supplements may also interfere with your other medications.

### **CoQ10 for Aerobic Metabolism restart (Breast Cancer)**

#### Signs and Symptoms

**Some women have signs and symptoms of breast cancer before diagnosis. Breast cancer can change how the breast or nipple feels. The most common symptom is a lump in the breast or in the armpit. Lumps in the upper, outer quadrant of the breast are most common.**

**Instead of a lump, women may feel swelling, tenderness, or thickening.**

**Cancer may also change the texture of the skin covering the breast. The pores may become enlarged. Cancer can also cause dimpling, swelling, or shrinking of the breast. Occasionally, women may notice a discharge from their nipples. Many women may not have any of these signs or symptoms before breast cancer diagnosis, and their cancer is detected during a routine mammogram.**

#### Types of breast cancer

**There are different clinical types of breast cancer:**

- **Inflammatory: synchronous, metachronous,**
- **Morphological: ductal, lobular, metaplastic**
- **Immunohistochemical: triple negative, positive hormone receptors, Her 2 positive**

#### Breast Cancer Diagnosis

**Diagnostic methods include:**

- **Physical and exploratory exam of the breasts.**
- **Mammography detects structural abnormalities of the tissue to evaluate its characteristics in greater detail.**
- **Ultrasound uses sound waves to produce images of deep structures and evaluate whether the breast nodule is a solid mass or a benign lesion.**
- **Biopsy is the only definitive way to make a diagnosis of breast cancer. And it is necessary to know precisely the characteristics of the tumor.**

- **MRI is used for special clinical conditions and does not use radiation to create images of breast tissue.**

#### Holistic medicine for Breast Cancer

**Integrative interventions improve the body's ability to fight this disease and manage side effects of conventional treatments.**

**Nutrition, proper supplementation and the use of innovative therapies such as Autologous cellular therapies, systemic perfusion hyperthermia and the use of dendritic enhancer treatments put our patients on the right path to healing. Integrative cancer therapies are used to support and enhance the effects of primary cancer therapies in eradicating or reducing cancer's burden on the body, and to help prevent cancer recurrence and increase survival**

**Some of the most common integrative treatments used when treating breast cancer patients are:**

**Immunotherapy** The goal of cancer immunotherapy is to improve the body's natural ability to find and destroy cancer cells. Successful immunotherapeutic approaches stimulate the natural defenses of the immune system and provide new ways to attack cancer. This is possible with comprehensive interventions that include cell therapy / immuno-pharmacological therapy in combination with nutritional, endocrine measures and supplements.

**Dendritic enhancer or T-cell modulators** T-cell Modulators are peptide chains composed of tens of amino acids that appear to store all the experience of the immune system. The great intellectual leap to understand is that T-cell Modulators do not transfer antibodies nor create them directly, but its function is to educate, and teach the immune cells to recognize specific antigens that could happen to them unnoticed i.e. Breast malignant cells.

T-cell Modulators do not cure anything but work to make a "smarter" immune system so that it is the body itself eliminating disease. They are therefore vital in developing the strategies of the immune system against cancer.

T-cell Modulators contains several immunoactive components that have been shown to act synergistically in raising Dendritic and NK function and also effective as adjuvant therapy in Breast cancer treatments, elevating dendritic and NK function as much as 250%.

Hyperthermia involves the use of heat to directly treat a tumor or increase the vulnerability of cancer cells to other forms of treatment, such as immunotherapy, B17, vitamin C, chemotherapy or radiotherapy.

In a group of patients with superficial breast cancer and chest wall recurrence, the addition of hyperthermia to their treatment increased local tumor eradication, and recurrence.

Mistletoe helps fight tumor-induced immune suppression. Natural killer cells (NK) are a type of white blood cell that looks for and destroys breast cancer

cells. Research has shown that NK cells can spontaneously recognize and kill a variety of breast cancer cells.

Mistletoe has been called a “biological response modifier” due to its ability to improve various aspects of immune function. Studies show that it activates natural killer cells, T cells, macrophages and monocytes.

A special proprietary form of liposomal mistletoe created with nanotechnology has been created for use in our breast cancer treatment approach.

**Glutathione** is the most important antioxidant produced by your body and a master detoxifier of every cell in your body. It prevents cellular damage caused by free radicals and peroxides.

Glutathione metabolism is able to play both protective and pathogenic roles. It is crucial in the removal and detoxification of carcinogens, and alterations in this pathway can have a profound effect on cell survival. However, by conferring resistance to a number of chemotherapeutic drugs, elevated levels of glutathione in tumor cells are able to protect such cells

**Personalized nutrition** A typical diet, characterized by dependence on animal products, refined carbohydrates and unhealthy fats such as processed vegetable oils, can promote an inflammatory environment in the body. A pro-inflammatory diet has been associated with an increased risk of breast cancer and an increased risk of death from breast cancer.

We custom-make a diet targeted to enhance the immune system’s ability to heal and provide our patients with the right nutrition for their current and long-term needs.

**Vitamins and supplements** Breast cancer patients who take supplemental vitamins, including vitamin C, are 22% less likely to have a recurrence of breast cancer after treatment than those who do not take supplements.

Women who take vitamin C after diagnosis are 15% less likely to die of the disease than those who do not take the supplement.

**Selenium** In one study, selenium levels were measured in the blood of 546 patients with a recent diagnosis of breast cancer. Women with the lowest levels of selenium were more than twice as likely to die during the five-year follow-up than women with the highest levels. A second study found that breast cancer patients with high dietary selenium intake were significantly less likely to die from the disease.

We use intravenous selenium as part of our breast cancer treatment approach.
