

*Beyond Debate:
Answers to 50 Misconceptions on Climate Change*

Contents

Preface	vii
Introduction: Climate Change 101	1
Natural Change	
1. Greenhouse gases don't really trap heat.	21
2. No one really knows what prehistoric CO ₂ and temperature were like.	25
3. Volcanoes are warming the earth, NOT people!	31
4. Earth's natural cycles can explain recent warming.	24
5. Solar cycles are to blame!	36
Climate Conspiracy	
6. Scientists are "in" on a climate hoax!	41
7. There's no 97% climate consensus	44
8. Climate change is a Chinese hoax!	47
9. Climategate - What about "the emails?"	51
10. "Glaciergate" proves a climate conspiracy	55
11. The IPCC is corrupt and/or misleading	58
Doubt	
12. Climate change is just a "theory"	63
13. The atmosphere is huge, we can't possibly affect it.	65
14. The scientists are wrong!	74
15. There is still "uncertainty" around climate change.	76
16. Most climate studies aren't even about the "climate science"	83
17. The "climate debate" means the science isn't settled	86
18. Temperature and CO ₂ are within the range of natural variation	92
19. CO ₂ can't be measured with precision.	97
20. Scientists are just defending their work!	99
21. How can we predict next year's climate when we can hardly predict next week's weather?	104
22. Warming is due to the urban heat island effect	110
23. Climate models don't account for the strongest greenhouse gas—water vapor!	113
24. Don't you know the sun is getting brighter?	117
25. We breathe out CO ₂ , so how bad can it be?	119

26. CO ₂ isn't even toxic!	124
27. Extreme weather is old news and is not due to climate change.	129
Jobs & the Economy	
28. Environmental regulation is bad for the economy	137
29. A carbon tax is just a way for the government to take our money!	141
30. Green energy is killing jobs!	146
31. The Paris Climate Accord was a "bad deal" for the U.S.	150
32. Pricing carbon will hinder the free market	155
Conflicting Evidence	
33. CO ₂ levels aren't really increasing	163
34. What about mid-century cooling?	168
35. Paleoclimate graphs show that CO ₂ rises after temperature rises, not before.	173
36. Glaciers aren't melting, Antarctica is even gaining ice!	179
37. What about that global warming "hiatus" a few years back?	185
38. Sea levels around Greenland and are falling!	188
39. Greenland used to be green, so the earth must be cooling.	192
40. What about the Medieval Warming Period?	195
41. We're still emerging from the Little Ice Age	198
42. Some areas are getting colder, so where's the global warming?	202
The Flip Side	
43. More CO ₂ is good for plants and agriculture!	207
44. Who cares about 1-2 degrees of warming? Maybe it's a good thing!	215
45. Geo-engineering will save us!	221
46. Plants and animals will adapt.	228
Solutions	
47. Electric cars aren't all that green!	241
48. The public is divided on global warming	248
49. It's too late for the climate.	255
50. I'm only one person. There's nothing I can do.	260
