

The *dewbie* is a handmade ‘tool’ that focuses on quickly and inexpensively re-hydrating dry cannabis and tobacco. This kiln-fired, porous stone is made in Calgary from locally sourced clay and is packaged in a drawstring hemp bag. Requiring only clean tap water to re-charge, the *dewbie* is infinitely reusable.

#### IT'S EASY TO USE - JUST ADD WATER

- Soak the *dewbie* in clean tap water, or just add droplets for a lower moisture level
- Dab dry and then nestle your *dewbie* against buds for roughly 10 minutes per gram\*
- Remove *dewbie* when no longer needed, to avoid over-hydrating
- Works best at room temperature
- Can be easily washed with soap & water, or placed in hot oven for 20 min to sterilize.

*\*Length of time depends on numerous factors; please read on.*

#### FAQ

**How long should I soak the *dewbie* for?** The *dewbie* will soak up a maximum of 2 grams of water over 2 minutes, but works at varying levels with less water. For instance, add only 10 or 20 droplets of water and use the *dewbie* to maintain a small stash’s moisture level over time and exposure to air (see “Replacing Relative Humidity packs” below)

**How long should I leave a wet stone in my cannabis?** That’ll be determined by how much bud you’re re-hydrating, how dry it is to begin with, the size of your storage container and how well it seals, and the desired final moisture content. Generally, a *dewbie* will refresh a couple of grams in about 10 to 20 minutes using a small jar with an airtight lid; but a really dry quarter ounce can take an hour or so. In the case of an ounce, rehydration may take 8 hours, or longer. Note: Your 28 grams of dry cannabis will then weigh as much as 30 grams or more once rehydrated, by simply returning to it what it’s missing – moisture! More importantly, each hit will be smoother, tastier, simply better.

**Can/Should I leave the *dewbie* in my stash?** It is perfectly safe to leave your *dewbie* in your stash, **but if you were to leave a well-soaked *dewbie* in a sealed container with a relatively small amount of cannabis for too long, you risk over-hydrating your stash.** If this happens, simply air dry buds by leaving the lid off of your stash, or spread them out on a piece of paper until (reasonably) dry again (brown paper bag works good, too).

**What about replacing Relative Humidity packs such as Boveda/Integra Packs?** The *dewbie* can be used to either augment or replace RH (Relative Humidity) packs:

- In the former, by providing hyper-speed re-hydration, followed by the removal and replacement of the *dewbie* with an RH pack to maintain the herb’s moisture level.
- In the latter, by applying a “relative wetting” to the *dewbie* to maintain your stash’s moisture level, over time, while avoiding over-hydration (eg, apply only 5 or 10 drops of water to a *dewbie* to maintain the RH of 5 to 10 grams of herb over time). Relative humidity is easily maintainable with these porous ‘tools’, but may require some learning on behalf of the user.

**What’s the background story with the *dewbie*?** With the help of his wife and kids, artisan Dennis Caul works from his home in Calgary, Alberta to handcraft the *dewbie* from locally sourced clay. Each “blank” is individually extruded, cut, stamped, polished and dried before being fired in a kiln at over 2000 degrees. Once cooled, the fresh *dewbie* then receives its own drawstring hemp bag, and labeled using recycled-material, Kraft paper.

In every step, each *dewbie* is infused with love & good intentions for the consumer and the planet. More information about the *dewbie* including a short video can be found at [www.thedevilslettuce.com](http://www.thedevilslettuce.com).
