A WILDLIFE HOSPITAL

Purpose-built medical, rehabilitation, and release facilities for Utah's native wildlife, with capacity for complex cases and species ranging from hummingbirds to eagles, beavers, and otters.

EDUCATION & PREVENTION

A large classroom and WRCNU's Wildlife Ambassadors will help schoolchildren connect with native wildlife while learning how human actions affect animals, habitat, and conservation.

TRAINING & COLLABORATION

Building on WRCNU's work with Utah State University's Beaver Ecology & Relocation Collaborative and renewed discussions about future collaboration with USU's veterinary program and other wildlife professionals.

CONSERVATION BUILT IN

Solar power, ground-source heating and cooling, natural daylighting, water-wise native landscaping, and energy-efficient systems make sustainability part of both the facility and what WRCNU teaches.

Our goal isn't simply to build a place where injured wildlife can heal. We want to build a place where people learn why these animals needed our help in the first place and how they can prevent it from happening again.

The need for professional wildlife care in Utah far exceeds the capacity currently available to meet it. This facility is our opportunity to change that.
