

BLEACH CLEANABLE PERFORMANCE FABRICS

- Cleanability is inherent in the fiber without chemicals!
- Titan fabrics are mostly woven with solution dyed polyester yarns or solution dyed olefin (polypropylene). Special bleach safe dyes are used for prints and occasionally for package dyed polyester.
- Solution dyed means that the color is added while the polymer is melted and extruded.
- Titan fabrics use yarns that are either extruded internally or extruded by our partners in the southeastern USA.
- Solution dyed yarns are bleach cleanable because the color becomes part of the fibers.
- Solution dyed yarns have enhanced light fastness, making them ideal for indoor use near windows.
- Liquid dyes and wet processes are not used while extruding solution dyed yarns which is environmentally friendly.
- Titan bleach cleanable prints feature superior technology and are woven and printed in our North Carolina mill.
- Titan fabrics have no chemical additives: no fluorochemicals, no antimicrobials, no silicones, no formaldehyde, no flame retardant chemicals.
- We use the very latest computer controlled equipment for the best quality and environmentally friendly production.
- Titan fabrics can be easily spot cleaned with soap and water, and then air dried. They are also bleach cleanable.
- Titan fabrics are made in the USA.
