

IMPROVED FEED EFFICIENCY FOR YOUR BEEF CATTLE

Enogen™ corn for feed offers proven, high-yielding hybrids that can help deliver improved feed efficiency, potentially lowering feed costs for your beef operation.

Improved Feed Efficiency of About 5% when fed as grain or silage¹

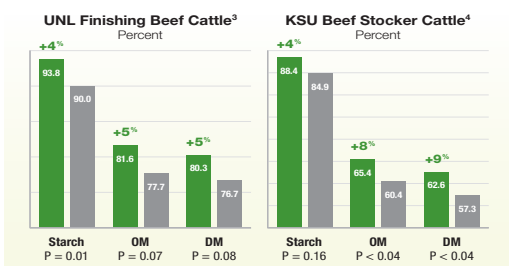

Enogen corn can improve feed efficiency in growing and finishing beef cattle, whether you feed it as whole-shelled (WSC), dry-rolled (DRC) or steam-flaked corn (SFC), or as silage. You also get:

- **Farm-proven results**, with demonstrated yield potential and elite genetics and traits
- **Ultimate flexibility**, with the option to harvest as silage, high-moisture corn or grain
- **Silage quality and consistency**, delivering greater levels of starch digestibility and more immediately available nutrients from day one after harvest and for more than eight months in the silo²

More Available Energy in Every Pound

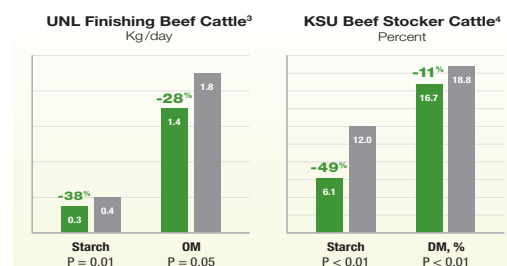

Enogen corn contains a robust amylase enzyme that quickly converts starch to usable sugars, meaning there is more available energy per pound of Enogen silage or grain than in any other corn. Improved starch digestibility means more available energy for your beef cattle with improved total tract digestion and reduced fecal output, as shown by university data.^{3,4}

Total Tract Digestibility

- Both studies showed increases in total tract digestibility of starch, organic matter (OM) and dry matter (DM) when Enogen grain was included in feed rations in place of conventional grain.

Fecal Output

- Reduced fecal output of starch and OM or DM when cattle were fed Enogen grain confirms that more of the nutrients consumed are being retained for conversion into energy by the animals.

For more information, visit Syngenta.ca/Enogen or contact your Enogen representative.

Silage Quality and Consistency

▶ Enogen silage may last longer than other silage⁴

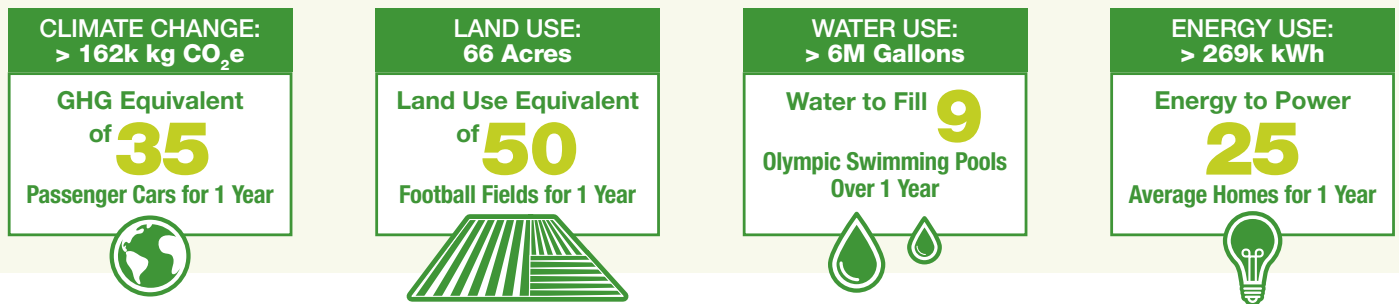

- **+42 hours of aerobic stability** in a standard lab “bucket” test
- **12% higher level of acetate** (which may act as a preservative)

▶ Enogen shows unmatched starch digestibility²

Paving the Path to Sustainable Beef Production

- ▶ Life Cycle Assessment (LCA) shows **potential environmental savings could be significant** — increasing feed efficiency by about 5% in backgrounding and the feed yard could yield savings like these per 1,000 head.⁵

OUR STEWARDSHIP COMMITMENT

As a high-value output product, Enogen corn for feed must be grown as an Identity Preserved (IP) crop and fed on-farm only. Farmers must adhere to all applicable stewardship requirements and sign and comply with an Enogen contract with Syngenta.
