## Urine drug screen

A urine drug screen is used to detect illegal and some prescription drugs in the urine.

### How the Test is Performed

Before the test, you may be asked to remove all your clothes and wear a hospital gown. You will then be placed in a room where you have no access to your personal items or water. This is so you cannot dilute the sample, or use someone else's urine for the test.

This test involves collecting a "clean-catch" (midstream) urine sample:

- Wash your hands with soap and water. Dry your hands with a clean towel.
- Men and boys should wipe the head of the penis with a moist cloth or disposable towelette. Before cleaning, gently pull back (retract) the foreskin, if you have one.
- Women and girls need to wash the area between the lips of the vagina with soapy water and rinse well. Or, if instructed, use a disposable towelette to wipe the genital area.
- As you start to urinate, allow a small amount to fall into the toilet bowl. This clears the urethra of contaminants.
- Then, in the container you are given, catch about 1 to 2 ounces (30 to 60 milliliters) of urine. Remove the container from the urine stream.
- Give the container to the health care provider or assistant.
- Wash your hands again with soap and water.

The sample is then taken to the lab for evaluation.

### How the Test will Feel

The test involves only normal urination.

### Why the Test is Performed
