# Certified Reference Materials and Standards

Accurate, precise and consistent results

Our portfolio of over 20,000 products includes reference standards and Certified Reference Materials for analytical testing applications including pharmaceutical, food & beverage, environmental, clinical diagnostic, toxicology & forensic, veterinary, petrochemical, cosmetics, dietary supplements & natural products, GMO standards, and much more!

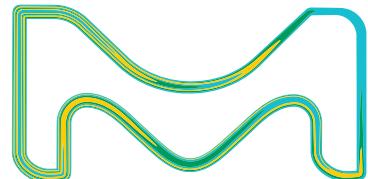

Our wide portfolio also includes OEM in addition to custom products and services.

Our reference material manufacturing sites are at a minimum double accredited to the highest achievable quality level for reference material producers:

ISO 17034 / Guide 34, ISO/IEC 17025, ISO 17043, ISO 13485 and ISO 9001

**Consistency is our standard.**

# Reference Materials you can rely on

## Our high standards match yours

Reference materials are particularly important in analytical chemistry to ensure test accuracy. They are essential for validation of methods, accurate calibration of measurement systems, and effective quality control. Research grade working standards are not fully characterized and certified, which is why we recommend reference materials (RMs) and certified reference materials (CRMs) to ensure accuracy and reproducibility. Results are only as accurate as your reference.

## Consistency is our standard

Our analytical chemists have developed organic, inorganic, and microorganism reference materials which can be used to calibrate simple measurements like pH, all the way to testing applications involving complex diagnoses such as thyroid cancer. Our reliable Cerilliant®, TraceCERT® and Certipur® product lines deliver high-quality standards and certified reference materials to ensure accuracy and reliable results while supporting each laboratory's requirements.

## Compliance, always ensured

Regulatory compliance is a critical component of a reference material. With a meticulous supply-chain compliance and regulatory documentation—all our products are tested to industry-specific protocols to ensure the highest standards.

Our systems & processes are inspected and certified by the same regulatory agencies and accreditation bodies that audit your work, including the FDA and the EPA. We develop innovative products in collaboration with national metrology institutes, pharmacopeias and governmental agencies.

Whatever your field of analysis is, we want to help you provide accurate, precise and consistent results. Make sure your decisions are based on accurate and reliable data achieved with Supelco® reference materials and certified reference materials.

## Reference Materials Production Sites

Pharmaceutical secondary standards,  
matrix environmental CRMs and  
proficiency testing schemes

**Laramie, USA**

Certipur® inorganic  
and elemental CRMs  
**Darmstadt, Germany**

Cerilliant® clinical diagnostic,  
forensic toxicology, and  
pharmaceutical CRMs and RMs

**Round Rock, USA**

TraceCERT® organic and inorganic CRMs, organic  
RMs (pesticides), and inorganic custom mixes

## A comprehensive portfolio of chemical standards and reference materials

- Pharmaceuticals and their Impurities
- Drugs of Abuse and their Metabolites
- Endogenous Diagnostic Biomarkers
- Pesticides and Environmental Contaminants
- Vitamins and Natural Products
- Elemental Standards
- Physical Properties (pH, Water Content, Color, etc.)
- Microbiology
- Proficiency Testing
- Stable Isotope Labeled Internal Standards
- Multiple third-party partners including USP and NIST
- Custom services including manufacture, certification, synthesis, packaging, distribution, and inventory management of reference materials

## Testing Applications

- Pharmaceutical QC
- Clinical/Diagnostic & Forensic Testing
- Food, Beverage & Cosmetics
- Environmental Testing
- Chemical Processing/Petrochem
- Cannabis Testing

## Fully certified certified reference materials to the highest industry standards

- Four production sites doubly accredited to ISO 17034/Guide 34 and ISO/IEC 17025
- Use of validated or qualified testing methods
- Certificate of Analysis, including uncertainty and traceability to meet regulatory requirements
- Real-time assessment of stability and setting of expiry dates and storage conditions based on scientific data

For our comprehensive portfolio of standards and reference materials visit us at: [SigmaAldrich.com/Standards](https://SigmaAldrich.com/Standards)

On our portal we have a search engine to easily find the certified reference materials & standards you need.

# New Look, Same Cerilliant® Quality

A new look on our Cerilliant® Certificates of Analysis (COA), but with the same quality and level of detail you've come to expect. COAs of Cerilliant® Certified Reference Materials include full details of all analyses, including method, run conditions, chromatograms, and spectral data. For catalog products, each COA includes detailed raw material characterization data as well as verification of solution standard concentration, solution purity, lot-to-lot consistency and homogeneity. For custom products, each COA provides a clear summary of analytical data and customer specifications.

Search for COAs by lot number on the individual product detail page, under the Safety & Documentation section – [www.sigmaaldrich.com](http://www.sigmaaldrich.com)

- **Expiration/Retest Date**

Established through real-time stability studies with acceptance criteria for both purity and concentration.

- **Isotopic Purity**

Isotopic distribution is shown for stable-labeled materials.

- **Concentration & Uncertainty**

Represents the actual concentration (not theoretical) based on material weighings and material Purity Factor. Concentration incorporates any necessary adjustments for salts – no additional adjustment is needed prior to use.

- **Uncertainty Statement**

Provides details of what standards were used to develop the uncertainty value, the confidence interval, the coverage factor and the processes or steps incorporated.

- **Analytical Verification of Concentration & Ampoule to Ampoule Consistency**

The gravimetrically prepared concentration is verified analytically by comparison to an independently prepared calibration solution. Lot-to-lot consistency is demonstrated through analysis of the previous lot (where available).

- **Traceability Statement**

Describes traceability to SI units and higher order standards from NIST.

- **Solution Standards Assay**

Shows method used to assay solution to an independently prepared calibration solution. Analytical verification of solution purity post ampouling provides confirmation that no degradation or contamination has occurred.

- **Neat Material Characterization Summary & Purity Factor Assignment**

Cerilliant Certified Solution Standards begin with full characterization of the neat material including chromatographic purity and analyses for residual content including: water, solvent, and inorganics.

- **Chromatographic Purity**

Multiple techniques are utilized to determine chromatographic purity. Results must agree within 0.5% of each other. The Primary purity method is used for purity factor calculations. The Secondary purity method is utilized as a confirming method.

- **Purity Factor**

The purity factor (PF) mass balance measurement equation is used to calculate the amount of analyte required to achieve an accurate concentration of the solution standard, accounting for chromatographic purity and residuals.

- **Identity**

Multiple methods are utilized to determine neat material identity.

- **Neat Material Characterization Details**

Details of all neat material testing performed is provided along with run conditions and spectra.

- **Storage**

Long-term and short-term storage recommendations are made based on scientific studies.

- **Stability**

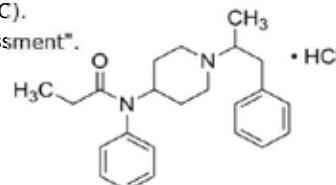

Results of short-term and accelerated stability studies provided to support shipping conditions and normal lab use.

## Certified Reference Material - Certificate of Analysis

<b>alpha-Methylfentanyl, Primary Measurement Standard</b> $(\pm)$ -N-[1-(1-methyl-2-phenylethyl)-4-piperidinyl]-N-phenyl-propanamide hydrochloride		<b>Cerilliant Quality</b>
<b>Product No.:</b>	M-214-0.5ML	ISO 17034
<b>Lot No.:</b>	FE05301802	ISO/IEC 17025
<b>Description of CRM:</b>	alpha-Methylfentanyl HCl in Methanol (Solution) Nominal concentration is adjusted for HCl content.	ISO 13485
<b>Retest Date:</b>	June 2020	ISO 14001
<b>Storage:</b>	Store unopened in freezer (-10 °C to -25 °C).	ISO 9001
<b>Shipping:</b>	Ambient. See Section "Stability Assessment".	
<b>Chemical formula:</b>	$C_{23}H_{30}N_2O \cdot HCl$	
<b>CAS No.:</b>	1443-44-3	
<b>Regulatory:</b>	USDEA Exempt   Canadian TK # 61-1682	

Analyte	Certified Concentration $\pm$ associated uncertainty U, $u=k*u$ ( $k=2$ )
alpha-Methylfentanyl	<b>100.0 <math>\pm</math> 0.6 µg/mL</b>

**Metrological traceability:** Traceable to the SI and higher order standards from NIST through an unbroken chain of comparisons. See "Details on metrological traceability" on page 2.

**Measurement method:** The certified value is calculated from high precision weighing of thoroughly characterized starting material. See "Details about certification process" on page 2.

**Intended use:** This Certified Reference Material is suitable for the in vitro identification, calibration, and quantification of the analyte(s) in analytical and R&D applications. Not suitable for human or animal consumption.

**Minimum sample size:** 1 µL for quantitative applications

**Instructions for handling and correct use:** Concentration is corrected for chromatographic purity, residual water, residual solvents, and residual inorganics. No adjustment required before use.

Users should quantitatively transfer desired volume using established good laboratory practices to spike into matrix or to dilute to the desired concentration. Each ampoule is intended for one-time use.

Nominal concentration is adjusted for HCl content. No adjustment required before use.

Danger. Please refer to the Safety Data Sheet for detailed information about the nature of any hazard and appropriate precautions to be taken.

**Accreditation:** Cerilliant Corp. is accredited by the US accreditation authority ANAB as registered reference material producer AR-1353 in accordance with ISO 17034 and registered testing laboratory AT-1352 according to ISO/IEC 17025.

Darron Ellsworth, Quality Assurance Manager

# ACCURATE RESULTS FOR TESTING LABORATORIES

Let's create lab efficiency.  
Together.

Whether you use IVD products in your hospital or reference lab, or create your own Lab Developed Tests (LDTs), cost per test, sensitivity, and the need to analyze novel markers with a high degree of control and transparency are important considerations.

From clinical mass spectrometry to tissue diagnostics, discover how we can support your lab with our full workflow solutions.

**consistency  
is our standard.**

[SigmaAldrich.com/standards](http://SigmaAldrich.com/standards)

## 1 SAMPLE COLLECTION

- Labware (bottles, vials, tubes, lids, bags, syringes)

## 2 SAMPLE PREPARATION

- Biologicals and enzymes
  - New Recombinant Limpet β-Glucuronidase
- SPE cartridges and 96-well plates (e.g. HybridSPE®, Supel™-Select SPE)
- Amicon® protein centrifugal filters
- Milli-Q® ultrapure water purification systems

## 3 ANALYSIS AND INTERPRETATION

- HPLC accessories
- HPLC & UHPLC columns
- Hardware
- Solvents and Buffers for HPLC and UHPLC
- Milli-Q® ultrapure water purification systems
- Cerilliant™ Certified Reference Materials (CRMs)

## 4 QA SUPPORT

- Proper supporting documentation with every audit
- Digitized product data with smart 2D Barcode labels

MilliporeSigma has brought together the world's leading Life Science brands, so whatever your life science problem, you can benefit from our expert products and services.

# SAME PRODUCTS NEW LABELS

As part of the Supelco® portfolio of analytical products from MilliporeSigma, we are updating our packaging and making vibrant science a reality by introducing smarter labels and more sustainable materials for all our Cerilliant® Certified Reference Materials (CRMs).

Rest assured, we're not changing the high standards of our comprehensive range of products or services that you've come to expect with Cerilliant® CRMs. The same Cerilliant® quality, just with a new label and packaging.

**Why Supelco®?** MilliporeSigma has created the Supelco portfolio of analytical products, built on providing accuracy and reliability, and developed for analytical chemists, by analytical chemists.

The rebranding of our product packaging and labeling is in conjunction with the realignment of our products into our six portfolio brands. To learn about each please visit: [SigmaAldrich.com/Packaging](https://SigmaAldrich.com/Packaging)

# Multi-Component Drug Standards and Kits

Cerilliant offers a broad selection of certified multi-component reference material solutions for a wide variety of quantitative or qualitative applications. These include forensic and clinical toxicology, therapeutic drug monitoring, clinical and diagnostic testing, prescription monitoring, clinical chemistry, dietary supplement quality control testing, environmental analysis of hormones and personal care products, endocrinology, and pharmaceutical research and release testing.

Cerilliant supplies its certified solution standards of controlled material in a convenient, quantitative, USDEA and Health Canada (with TK#s)-exempt solution format. Cerilliant reference standards are manufactured and certified to the highest industry standards including ISO Guide 17034, ISO/IEC 17025, and ISO 13485 and are compliant with ISO 17511 and ISO 15194.

# Acylcarnitines

Acylcarnitines are intermediates of fatty acid and amino acid oxidation found in tissues and body fluids. Acylcarnitines are important diagnostic markers for inherited diseases of peroxisomal and mitochondrial oxidation processes. Abnormalities in specific acylcarnitine concentrations are used in the identification of carnitine deficiency and diagnosis of fatty acid oxidation defects and organic acidurias, such as carnitine-acylcarnitine translocase deficiency (CACTD) or Isobutyryl-CoA dehydrogenase deficiency. Measuring different acylcarnitines can be used to detect more than 40 different inborn errors of metabolism. If these diseases are not diagnosed, the metabolic disorders can lead to severe irreversible harm to newborns within their first few days of life. Newborn screening programs aim to detect congenital metabolic disorders early on in infants before they become symptomatic. Liquid chromatography-tandem mass spectrometry (LC-MS/MS) has greatly increased the screening possibilities in newborn screening programs and has been established as an efficient and robust methodology for analyzing acyl-L-carnitines. Detection by MS provides the required sensitivity and direct infusion may be sufficient to detect several disorders with a single injection. For more detailed analysis and for measuring acylcarnitine isomers that are closely related, separation by liquid chromatography before detection is important.

# Alcohol Standards

MilliporeSigma's Cerilliant® brand offers a comprehensive portfolio of solution-based certified reference materials for blood alcohol/ethanol testing applications. These include single-component ethanol standards, multi-component alcohol mixes, ethyl glucuronide & ethyl sulfate urinary metabolites, phosphatidylethanol (PEth) alcohol biomarkers and their stable-labeled internal standards. PEth, or phosphatidylethanol, is a group of phospholipids formed only in the presence of ethanol from the action of phospholipase D. These direct alcohol biomarkers demonstrate high sensitivities appropriate for determining moderate to heavy alcohol consumption. The superior sensitivity and specificity of blood PEth over other alcohol biomarkers for determining alcohol consumption has resulted in its wide use and recommendation in the US and EU as a confirmatory test for recent drinking. We have the exclusive rights to manufacture, sell, and market CRMs of major PEth analogs in all global markets.

# Lots of different matrices? ONE MEMBRANE.

## Hydrophilic PTFE Millex® Filters

### Features and Benefits:

- Protect your HPLC results with HPLC-certified Millex® hydrophilic PTFE syringe filters.
- Millex®-LG, LCR filters contain hydrophilic PTFE membranes and are HPLC-certified for low levels of UV-absorbing extractables.
- Have broad chemical compatibility, enabling filtration of aqueous and organic solvents.
- 33 mm hydrophilic PTFE Millex® filters have faster flow rates than 25 mm filters.
- Easy to read membrane type and pore size printed on every Millex® filter.
- Over-molded design provides excellent seal integrity and burst strength.

Enhance your HPLC sample filtration with Millex® filters. Visit:

# Amphetamines

Amphetamines are central nervous system (CNS) stimulants that produce alertness, euphoria, and hallucinations in users. Many amphetamines are legally prescribed with therapeutic uses for medical conditions such as attention deficit hyperactivity disorder (ADD and ADHD), bipolar spectrum disorder, narcolepsy, Parkinson's disease and obesity. Because of their high potential for abuse, the substances are classified as Schedule II drugs by the U.S. Drug Enforcement Administration (DEA). Synthetic amphetamines are sold on the illicit drug markets and have recently experienced a surge in abuse worldwide. The chronic abuse of amphetamines can lead to serious problems, including brain and cardiovascular damage, malnutrition and psychosis. In high doses, amphetamines can make the user feel extremely nervous, anxious, confused and irritable or can lead to hostility, aggression and violence. The consequences of amphetamines overdose include collapse, seizure, heart failure, stroke and death.

# Analgesics (Non-Opiates)

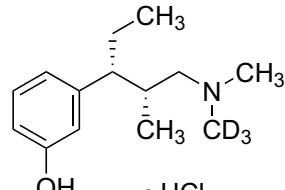

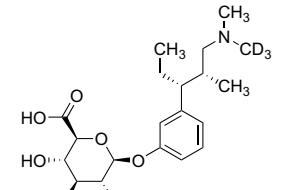

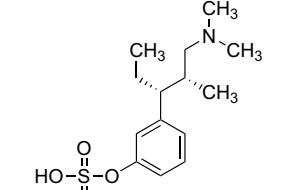

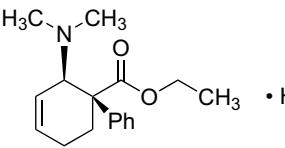

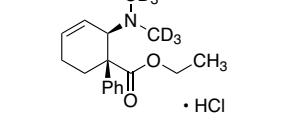

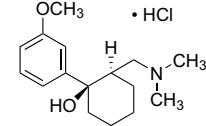

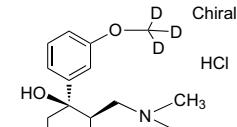

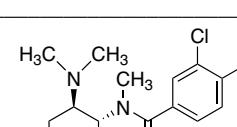

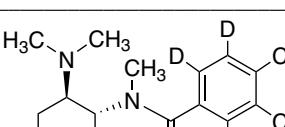

Analgesics such as synthetic opioids are primarily used in the management of acute and chronic pain but are also highly susceptible to misuse and diversion. Analgesic drugs act in various ways on the peripheral and central nervous systems without inducing sleep or loss of consciousness. Commonly prescribed analgesics in the synthetic opioid class include meperidine, tramadol, and tilidine. New analgesics like tapentadol offer improved pain relief through multiple modes of action compared to the  $\mu$ -opioid receptor agonist mode of older synthetic analgesics. Many synthetic analgesics have international abuse potential and recently experienced a surge in abuse worldwide due to ambiguous control status, wide availability, and similar or greater potency than many opiates including morphine and heroin.

# Anesthetics

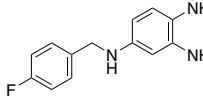

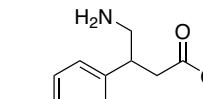

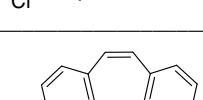

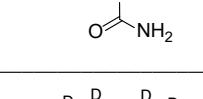

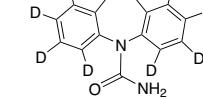

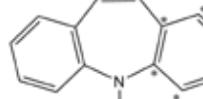

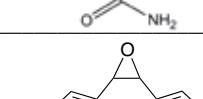

Anesthetics are a group of drugs used for both induction and maintenance of anesthesia as well as for pre-operative sedation. These drugs possess a high potential for addiction and physical dependence and abuse of anesthetics such as propofol and lidocaine is a major issue among health professionals. Recreational abuse of anesthetic drugs and related designer analogs including ketamine,  $\gamma$ -hydroxybutyrate (GHB) and lidocaine have steadily increased around the world. The rise is attributed to their wide availability through online clandestine drug markets and their popularity as club drugs.

# **Anticonvulsants/Antiepileptics**

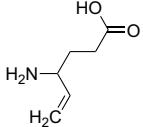

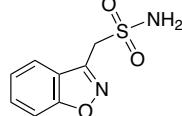

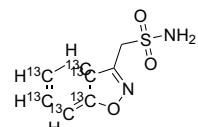

Anticonvulsants, or antiepileptics (AEDs), are a structurally diverse category of drugs used for the treatment of partial and generalized seizures and epilepsy. Antiepileptics have also shown therapeutic efficacy in the management of mood disorders, borderline personality disorder and neuropathic pain. Today, second generation antiepileptics such as levetiracetam, gabapentin, pregabalin, rufinamide, retigabine, and lacosamide have largely supplanted first generation antiepileptics such as phenytoin, valproic acid, and barbiturates which have historically been used to treat seizure disorders. In contrast to first generation AEDs, second generation antiepileptics have a wider gap between therapeutic and toxic serum concentrations and exhibit fewer side effects. Since the frequency, intensity, and type of seizure disease vary among patients, therapeutic drug monitoring (TDM) of antiepileptics is performed to optimize drug efficacy while keeping dosages within the therapeutic range. Routine analytical testing of antiepileptics is also useful in assessing compliance, evaluating overdose, and determining drug-drug interactions.

## Protein Certified Reference Materials

For clinical and food testing applications

New CRMs of fully intact proteins, both native and stable isotope-labeled, for calibration, quality control, and internal standardization of LC-MS/MS clinical and food testing methods.

- Clinical biomarkers including thyroglobulin, IGF-1, insulin, and C-peptide
- Food allergens such as lactoferrin, α-lactalbumin, and β-lactoglobulin A & B
- Lyophilized or solution formats
- Ready-to-use – Reduces labor, cost and eliminates preparation as source of error
- Stability pre-determined & supported with testing data

**Accurate reference, accurate results.**

# Antidepressants

Antidepressants are drugs used to treat major depressive disorder and other conditions, including anxiety disorders, chronic pain conditions (off-label use), and to help manage addictions. Common side-effects of antidepressants include dry mouth, weight gain, dizziness, headaches, and sexual dysfunction. Depression is a psychiatric condition that affects an estimated 350 million people worldwide and can impair an individual's ability to take care of their everyday responsibilities. Widely used to manage depression and related mood disorders, antidepressants may be grouped into major classes consisting of selective serotonin reuptake inhibitors (SSRIs), serotonin-norepinephrine reuptake inhibitors (SNRIs), tricyclics (TCAs), monoamine oxidase inhibitors (MAOIs), and tetracyclics. Antidepressants have expanded in use with prescription rates increasing worldwide. Explanations for rising antidepressant use include increased cultural acceptance of antidepressants and extended efficacy of antidepressants for multiple health conditions. Since antidepressants can impair cognitive and psychomotor function and may increase the risk of driving accidents or voluntary intoxication, they are routinely analyzed in forensic or clinical toxicology applications using mass spectrometry methods. In a clinical setting, therapeutic drug monitoring (TDM) of tricyclic antidepressants may be performed to reduce drug-drug interactions, to monitor patient compliance, and to optimize dosing within the drug's therapeutic range.

# Ascentis® Express UHPLC and HPLC Columns

## Designed to deliver speed and resolution

The Fused-Core® technology behind our Ascentis® Express columns delivers maximum speed and efficiency on both UHPLC and HPLC systems.

### Key Features and Benefits

- Maximize speed with sharp peaks even at ultra-high flow rates
- More choices for fast HPLC with 2.0, 2.7, and 5.0 µm Fused-Core® particles
- Suitable for all UHPLC, HPLC and LC/MS instruments
- Phases available include: C8, C18, AQ-C18 (NEW!), C30, Peptide ES-C18, RP-Amide, Phenyl-Hexyl, Biphenyl, F5 (PFP), ES Cyano, OH-5 and HILIC

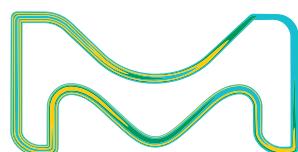

The innovative manufacturing process for Fused-Core particles produces a very narrow particle size distribution. A narrow particle size distribution allows for the use of large porosity frits that resist clogging, resulting in a more rugged column.

Traditional porous particles are not manufactured in a way to yield extremely narrow particle size distributions.

# Antifungals

Antifungals are a class of drugs used for the treatment of invasive and systemic fungal infections. Antifungal drugs are classified into several groups based on their molecular structure or mechanism of action. Major groups include the triazoles consisting of fluconazole, itraconazole, voriconazole or posaconazole; imidazoles such as ketoconazole; and antimicrobials. As a result of their high toxicity, narrow therapeutic range, and variable bioavailability, antifungals present significant clinical challenges to patients with severely compromised immune systems. Due to these issues, therapeutic drug monitoring (TDM) of antifungal levels is performed by clinical and diagnostic testing laboratories using HPLC or LC-MS/MS to ensure dosing remains within the drug's therapeutic range. Antifungals are also used as masking agents since they can potentially co-elute with illicit drugs in forensic or sports testing methods. The triazole antifungal fluconazole has been shown to produce false negative test results in GC/MS confirmation of cocaine use.

# Antihistamines

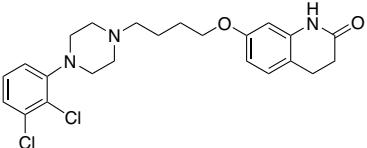

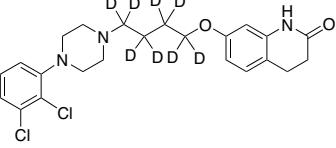

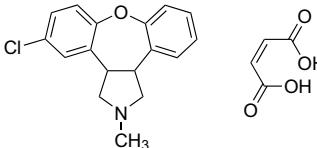

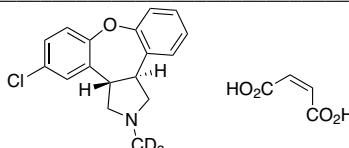

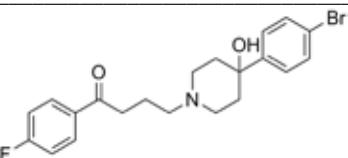

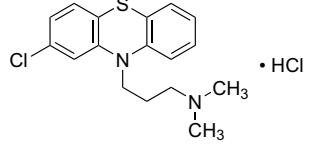

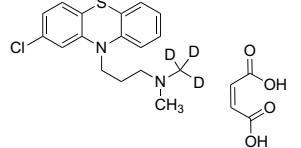

Antihistamines are popular medications used for symptomatic relief of cold and allergy symptoms and as sleeping aids. These drugs can produce intense feelings of sedation, which reportedly can be enhanced by alcohol. Although relatively safe, antihistamine use is implicated in motor vehicle, civil aviation, and boating accidents with deaths resulting from accidental or intentional overdose. Antihistamines function by inhibiting the action of histamine, a compound that regulates immediate hypersensitivity and allergic response. Currently available antihistamines are classified as either first generation H<sub>1</sub> receptor agonists or as second generation H<sub>2</sub> receptor agonists. These drugs, especially diphenhydramine, chlorpheniramine, and promethazine, are routinely analyzed in forensic laboratories to determine cause of death in cases of suspected suicide or drug-facilitated crime.

# Antipsychotics

Antipsychotics are a class of drugs used to treat a variety of mental health conditions, including schizophrenia spectrum disorders, bipolar disorder, attention-deficit/hyperactivity disorder (ADHD), opiate and alcohol addiction, sleep disorders, and depression. Antipsychotics have serious adverse effects associated with their use including rapid weight gain, diabetes, cardiovascular disease, and movement impairment. Antipsychotics are separated into two classes – first generation drugs known as typicals and newer second generation drugs called atypical. Both atypical and typical antipsychotics are routinely analyzed in clinical and forensic applications. For clinical and diagnostic testing, therapeutic drug monitoring (TDM) of antipsychotics may be indicated to assess medication adherence and to ensure dosing remains within the therapeutic range. While antipsychotics have historically been analyzed by GC/MS, many of the newer atypicals such as risperidone are not suitable for GC analysis due to thermal instability. HPLC and LC/MS have supplanted GC/MS for the analysis of antipsychotics in biological matrices, because liquid chromatographic systems do not require volatilization or derivatization of the analyte.

# Barbiturates

Barbiturates are chemical derivatives of barbituric acid that are therapeutically used as sedatives, hypnotics, anticonvulsants, anesthetics, and tranquilizers. Barbiturates have physical and psychological addiction potential and at high doses can cause a slowdown of the respiratory system, potentially leading to coma and death. Due to these effects, barbiturates have been implicated in many instances of suicide. Barbiturates have largely been replaced by benzodiazepines and nonbenzodiazepines (Z-drugs) in routine medical practice, particularly in the treatment of anxiety and insomnia. This is due to the significantly lower risk of addiction and overdose, and the lack of an antidote for barbiturate overdose.

# Automate Your SPE

## With HybridSPE® DPX® Tips

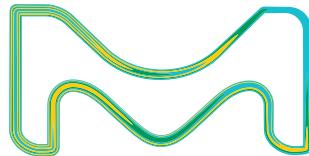

**Millipore Sigma**

DPX® stands for Dispersive Pipette Extraction. HybridSPE® DPX® Tips are pipette tips that incorporate loosely contained HybridSPE® sorbent material that is mixed with the sample solution when aspirated to accomplish solid phase extraction.

### Features and benefits:

- Minimal elution solvent volumes
- Protein and phospholipid removal
- Rapid extraction times with high extraction efficiencies
- Easy-to-perform extractions
- Lower costs
- Environmentally friendly

# Benzodiazepines

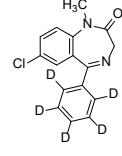

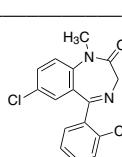

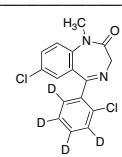

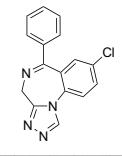

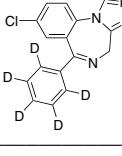

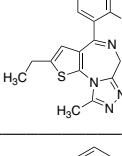

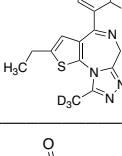

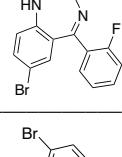

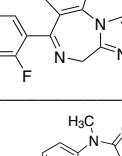

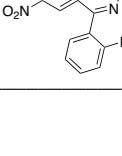

Benzodiazepines are a broad class of psychoactive drugs prescribed worldwide for treating various conditions including anxiety, insomnia, and muscle spasms. These drugs are classified as either short or long-acting. Short-acting benzodiazepines like triazolam are typically prescribed to treat insomnia. Long-acting benzodiazepines, such as diazepam, alprazolam, lorazepam, and prazepam, may be used to treat insomnia as well as other conditions including anxiety, seizures, or muscle spasms. Around the world, benzodiazepines are widely misused. Compounding the problem of benzodiazepine misuse is the trend among polydrug users to combine benzodiazepines with other drugs into potentially lethal drug mixes. Consumption of these drug mixes is associated with higher risk of overdose and mortality. Novel psychoactive substance (NPS) benzodiazepines have emerged in illicit online drug shops in the past couple of years. NPS benzodiazepines such as phenazepam, etizolam, nimetazepam and demoxepam have little to no known medical use, are more potent than pharmaceutical benzodiazepines, and are uncontrolled in many countries.

# Benzyl & Phenyl Piperazines

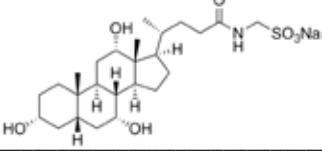

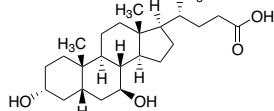

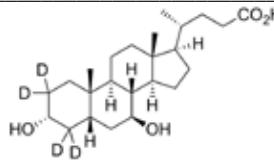

Piperazines are products of synthesis originally marketed as antihelminthic substances and proposed later as antidepressant drugs. Within the past several years, piperazines have emerged in clandestine drug markets as substitutes for controlled substances such as amphetamines and its derivatives due to the similar effects. This class of novel psychoactive substances (NPS) includes benzylpiperazines and phenylpiperazines such as Benzyl piperazine (BZP), 3-Trifluoromethylphenylpiperazine (TFMPP) and 1-(3-Chlorophenyl)piperazine (CPP). These compounds are often claimed by suppliers to be herbal products, though piperazine and its derivatives are all synthetic substances. Benzylpiperazines have a chemical structure similar to amphetamines but only one-tenth of its potency and are likely involved in both dopamine and noradrenaline release and inhibition of monoamine reuptake. In contrast, phenylpiperazines primarily enhance the release of serotonin by acting on the serotonin receptor or the reuptake transporter.

# Bile Acids

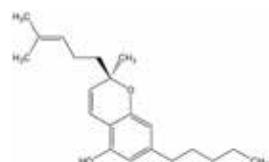

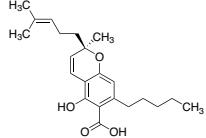

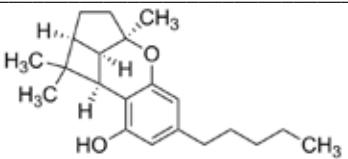

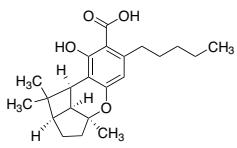

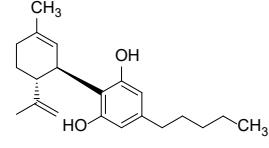

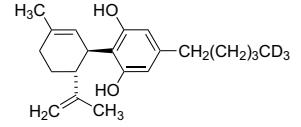

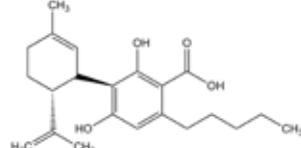

Bile acids are important signaling molecules with high relevance for many biological processes, found in the bile of mammals and other vertebrates. Despite their function to allow digestion of dietary fats and oils by acting as a surfactant that emulsifies them into micelles, bile acids also act as steroid hormones having various direct metabolic effects. Primary bile acids are synthesized by the liver, while secondary bile acids result from bacterial actions in the colon. In humans, the steroid acids taurocholic acid, glycocholic acid, taurochenodeoxycholic acid and glycochenodeoxycholic acid are the major bile acids found in bile. Bile acids are involved in the cholesterol metabolism and do have clinical significance in gastroenterology, hepatology, and gastroenterological oncology. For example, the measurement of the total bile acid pool to diagnose liver injury is clinical routine. Information on the individual composition of the bile acid pool can furthermore provide important insight into generation and metabolism of bile acids by both the gut microbiome and the liver.

# Cannabinoids

Cannabinoids are a class of psychoactive and non-psychoactive compounds produced in the Cannabis plant, commonly referred to as marijuana, and represent one of the most widely used drug classes worldwide. These drugs can produce intense psychological and physiological effects including auditory and visual hallucinations, anxiety, and euphoria. Despite their use as recreational drugs, these compounds have recently shown potential therapeutic efficacy in the treatment of many ailments from arthritis and chronic pain to glaucoma, epilepsy, and cancer. Whether smoked, consumed in food, applied as a cosmetic, or concentrated in a pill, cannabinoids found in Cannabis vary in potency, type, and specific therapeutic benefit and need to be tested to ensure cannabinoid identity as well as consistent purity and concentration. In North America and Europe, cannabis testing laboratories have introduced chromatographic MS based methods to quantify cannabinoids in medical and recreational cannabis to assess potency and specific therapeutic benefit. Because of their prevalence in drugged driving and medicolegal investigations, cannabinoids are routinely analyzed using GC/MS and LC/MS methods in forensic and clinical toxicology applications including postmortem, urine, and confirmation drug testing.

# Cardiac Drugs

Cardiac drugs include vasodilators, beta blockers, antiplatelet agents, statins, and calcium channel blockers. These medications are prescribed for the treatment of cardiac arrhythmias, congestive heart failure, and hypertension. Nearly all cardiac drugs have a narrow therapeutic range requiring careful therapeutic drug monitoring (TDM) to minimize the adverse side effects associated with these medications. Antiarrhythmics represent the largest class of cardiac drugs and are grouped into four classes. Class I drugs block sodium channels, thereby reducing arrhythmia. Class II cardioactive medicines like propranolol are beta-adrenergic blocking agents used to treat high blood pressure, chest pain and arrhythmia. Class III cardiac pharmaceuticals are potassium channel blockers used to treat supraventricular and life-threatening ventricular arrhythmias. Class IV drugs, including verapamil, are calcium channel blockers that treat hypertension, angina pectoris, cardiac arrhythmia, and cluster headaches.

**0.1% formic acid UHPLC solvent blends**

Consistent and easy mobile phase prep for every run.

**0.1% formic acid blends for Methanol, Acetonitrile & Water**

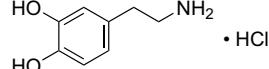

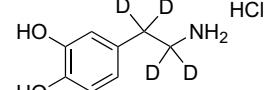

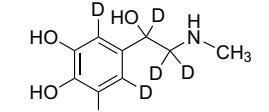

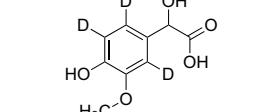

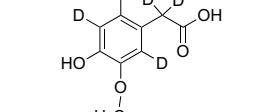

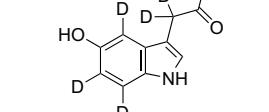

- High purity for extremely low detection limits
- Lot-to-lot reproducibility, extensive QC testing
- Microfiltered (0.2  $\mu$ m)
- Packaged in borosilicate glass containers
- Extremely low levels of alkali metal impurities

# Catecholamines

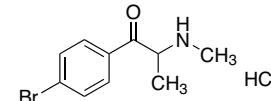

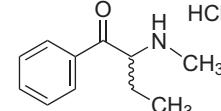

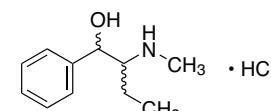

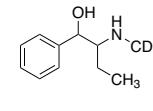

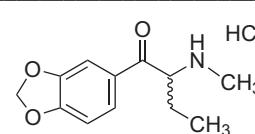

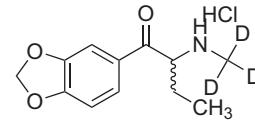

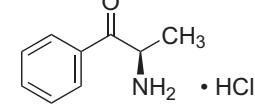

Catecholamines, or biogenic amines, are monoamine neurotransmitters derived from the amino acid tyrosine. This group of biologically active compounds plays a critical role in physiological functions, such as brain activity, the regulation of body temperature and stomach pH. Catecholamines are important parameters for the diagnosis of several diseases such as pheochromocytoma or other tumors of the nervous system. Epinephrine (adrenaline), norepinephrine (noradrenaline) and dopamine are a group of biogenic amines known as catecholamines. They are produced mainly by the chromaffin cells in the medulla of the adrenal gland. Significantly raised levels of catecholamines and their primary metabolites, metanephrines, including metanephrine, normetanephrine and 3-methoxytyramine, are used diagnostically as markers for the presence of a pheochromocytoma in symptomatic patients. Vanillylmandelic acid (VMA) and homovanillic acid (HVA) are end products of catecholamine metabolism. Increased urinary excretion of VMA and HVA is a diagnostic marker for neuroblastoma, one of the most common solid cancers in early childhood. The biogenic amine, serotonin, is an important neurotransmitter in the central nervous system. Several disorders are associated with pathological changes in serotonin concentrations. Serotonin deficiencies are related to disorders such as depression, schizophrenia, and Parkinson's disease. Serotonin excess on the other hand is attributed to carcinoid tumors. The determination of serotonin or its metabolite 5-hydroxyindoleacetic acid (5-HIAA) is a standard diagnostic test for carcinoid tumors.

## Cathinones

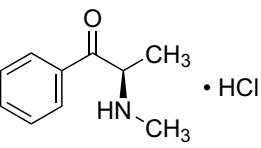

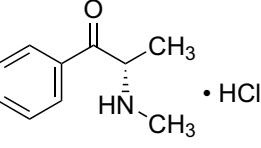

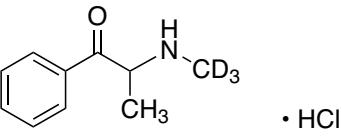

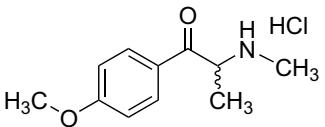

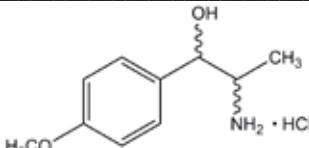

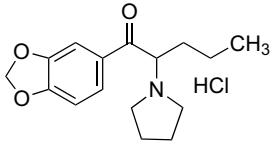

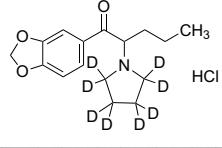

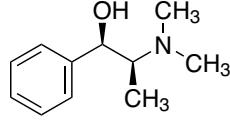

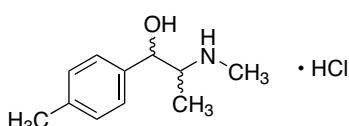

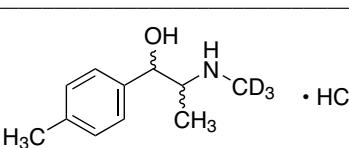

Synthetic cathinones are  $\beta$ -ketoamphetamines structurally related to amphetamines and cause similar effects. These novel amphetamine type stimulants (ATSSs) all originate from cathinone, an alkaloid with stimulant properties present in the leaves of *Catha edulis*, known as khat and emerged in illicit drug markets as substitutes for controlled substances in the mid 2000s. Marketed as bath salts, bath crystals or plant food, they are commonly known as Blue Silk, Purple Wave, White Knight, White Lightening, Ocean Burst, Ivory Snow, Ivory Wave, Pure Ivory, Snow Leopard, Stardust, and Vanilla Sky. 4-Methylmethcathinone (mephedrone), 3,4-methylenedioxymethcathinone (methylone), and 3,4-methylenedioxypyrovalerone (MDPV) are the most commonly used synthetic cathinones. Synthetic cathinones represent a valid alternative to MDMA and cocaine to drug users due to their hallucinogenic and stimulant properties, low cost and being perceived as more potent and with less side effects than other stimulants. Repeated use of these substances may lead to dependence and withdrawal symptoms such as tiredness, impaired concentration, insomnia, and nasal congestion. Mephedrone and MDPV were classified as Schedule I of the Controlled Substances Act of 2012 in the United States, followed by methylone and 40 other substances in 2013. In Europe, mephedrone started being controlled in December 2010, but it was soon replaced by new synthetic cathinones.

# Certified Reference Materials in Matrix

Cerilliant® Certified Spiking Solutions® and CRMs of endogenous biomarkers in biological matrices such as serum are manufactured and tested using validated processes to ensure the highest level of accuracy for critical quantitative mass spectrometry-based applications. The portfolio spans testing applications from therapeutic drug monitoring, diagnostic testing, clinical chemistry and endocrinology to pharmaceutical research, clinical toxicology, and forensic analysis. All single and multi-analyte matrix solutions are prepared at CRM grade, ensuring high accuracy of concentration with traceability & uncertainty defined at multiple concentration levels covering specific diagnostic ranges. Each individual concentration level is ready to be used as a linearity standard, or for calibration verification in LC-MS/MS testing methods. The pre-prepared, matrix-matched format offers laboratory benefits such as increased efficiency of labor and convenience of use, while avoiding potential preparation errors or errors in dilution during in-house preparation. The matrix-matched format can compensate for potential matrix effects. A blank matrix standard is available as well. Diagnostic testing methods are moving from Immunoassay to LC-MS/MS for greater sensitivity, specificity and better standardization. With manufacturing and testing under quality accreditations such as ISO Guide 17034, ISO/IEC 17025, and ISO 13485, accuracy of concentration can be assured for critical research applications in calibration verification, or verification of linear range within the laboratory's LC-MS/MS testing method.

Testosterone CRM in Serum, 750 ng/dL, USA Sale Only	58-22-0 $C_{19}H_{28}O_2$ M.W. 288.42	T-509-1ML	750 ng/dL 1 mL Stripped Serum	
Testosterone CRM in Serum, 2000 ng/dL, USA Sale Only	58-22-0 $C_{19}H_{28}O_2$ M.W. 288.42	T-510-1ML	2000 ng/dL 1 mL Stripped Serum	

# Accessorize your testing

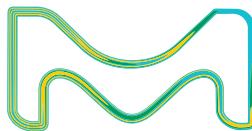

## Collection basics from vials to 96-well format

### Certified Low Adsorption (LA) Vials for HPLC and LC/MS

- Maintains sample integrity during storage
- Minimizes pH shifts in the sample
- Reduces metal contamination in the samples
- Compatible with most autosamplers

### 96-well Collection Plates and Sealing Mats

- Range of well volumes and materials available
- Flat, round and conical bottom formats with various plate depths to accommodate your autosampler
- In addition to MilliporeSigma plate options, choose from Nunc®, Corning® and GreinerBio®

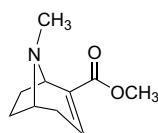

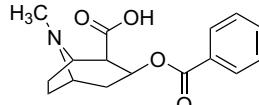

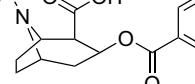

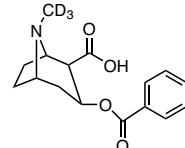

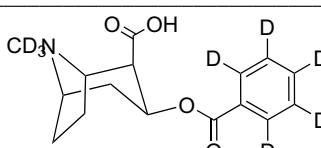

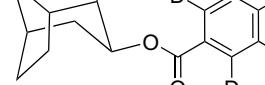

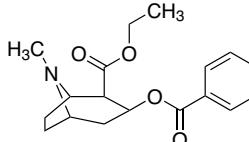

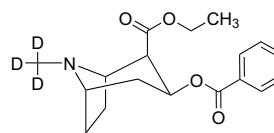

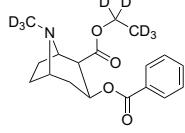

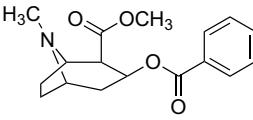

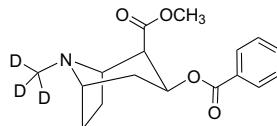

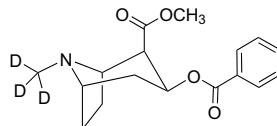

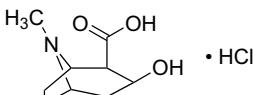

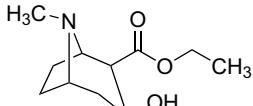

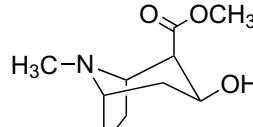

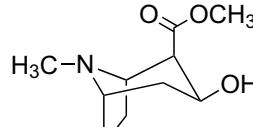

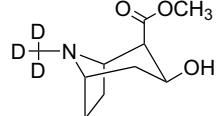

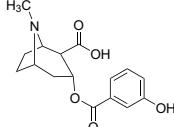

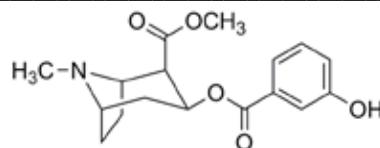

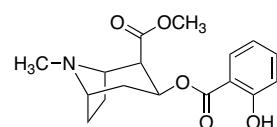

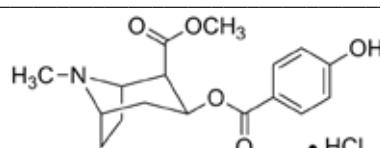

For more information, visit:

# Cocaine Analogs

Cocaine is one of the most widespread illicit drugs in the world. Cocaine and its analogs are powerful nervous system stimulants that have been linked with psychological dependence and repeat and impulsive abuse. Historically, GC/MS techniques have been used for the toxicological analysis of cocaine and its metabolites including benzoylecgonine (BE), cocaethylene (CE), ecgonine methylester (EME) and norcocaine (NOR). These metabolites are also reported as impurities in cocaine. Today LC/MS methods are routinely used to quantitate cocaine analogs and their metabolites in biological fluids for applications such as postmortem toxicology, workplace drug testing, forensic analysis, and neonatal meconium screening. Over the past several years, the emergence of more sensitive and specific analytical methods, including those by LC-MS/MS, has allowed identification of novel cocaine metabolites and impurities. These include thermally labile cocaine N-oxide which is a preferred analyte over other biomarkers for cocaine use in hair because it's less affected by external contamination than traditional cocaine metabolites.

## Fatty Acids

Free fatty acids (FFAs), also called nonesterified fatty acids (NEFA), account for 2% to 5% of all serum fatty acids circulating in blood plasma. Free fatty acids are protein-bound to albumin. Most of the free fatty acids are derived from either dietary sources or are mobilized from adipose tissue. Plasma free fatty acids are elevated in many obesity-related disorders and may contribute to insulin resistance in peripheral tissues. Knowledge of the individual level of FFAs in blood plasma can be helpful in the diagnosis and management of certain diseases and disorders of metabolism such as uncontrolled diabetes mellitus, hyperlipoproteinemia, and secondary hyperlipoproteinemia and conditions such as sepsis and tumors producing lipoactive hormones.

# Fentanyls

Fentanyls are rapid-acting synthetic  $\mu$ -opioid receptor agonists that depress the central nervous system (CNS) and may alleviate pain without causing loss of consciousness. Therefore, traditional fentanyls such as fentanyl, remifentanil and sufentanil are used in pain medication and anesthesia. The emergence of fentanyls as drugs of abuse represents the greatest challenge to current forensic toxicology. Recently, a huge number of new fentanyl structural variants, also known as designer fentanyls, have appeared on the illicit drug market. Often mixed with traditional opioid drugs, these highly potent fentanyl analogues have caused harmful intoxications and dramatically increased opioid related mortality in the United States, Europe and Asia. Over 90 overdose deaths in the U.S. occur each day due to opioids, particularly from fentanyl and its synthetic analogs. Abuse of opioids and fentanyls has been declared as a national public health emergency in the U.S., leading to stricter governmental regulations on opioid prescription, and new DEA regulations for fentanyl analogs. In the United States, the Drug Enforcement Agency placed the broadly defined class of Fentanyl-Related Substances on the list of Schedule I drugs in 2018, making it illegal to manufacture, distribute, or possess fentanyl analogs. Due to the very high potency of some fentanyl analogues, forensic testing labs performing LC-MS/MS fentanyl testing are facing the challenge of detecting minimal trace amounts of these drugs in biological samples while ensuring laboratory safety. To help address these safety challenges, we provide Certified Spiking Solutions® of the most potent fentanyl analogues, such as carfentanyl, in an ampoule additionally protected in a safety can, ensuring safe transport and handling in the lab.

# Opioid CRM Kits for Accurate Fentanyl Testing

Certified Reference Materials (CRMs) for detection of fentanyl-related analogs and other synthetic opioids

The Centers for Disease Control and Prevention (CDC) has developed Opioid Certified Reference Material (CRM) Kits to support laboratory detection of emerging opioids in the US.

Cerilliant®, a MilliporeSigma company, began distributing the Opioid CRM Kit in April, 2019.

#### Opioid CRM Kit:

- Includes 1 milligram each of 22 CRMs and their matched carbon-13 and nitrogen-15 isotopes
- Addresses 99.7 percent of DEA fentanyl/fentanyl-related cases in the DEA 2018 Q3 Report
- Improves confirmation of mass spectrometry method analysis

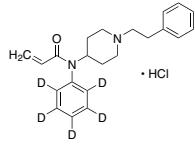

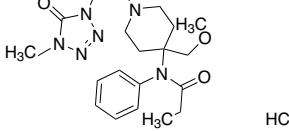

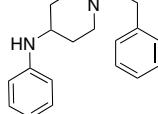

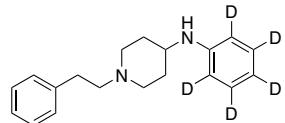

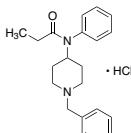

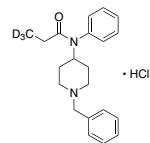

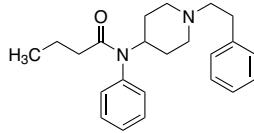

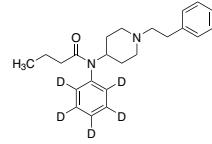

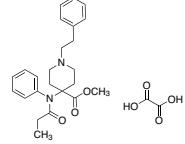

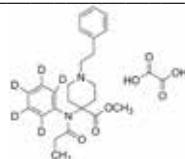

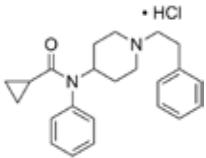

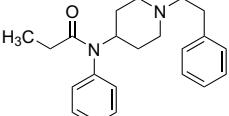

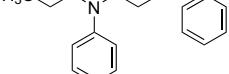

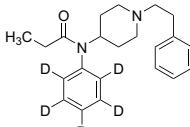

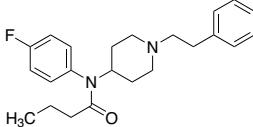

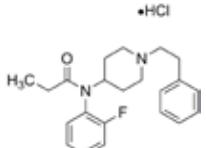

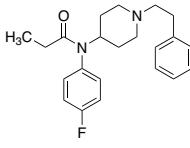

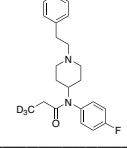

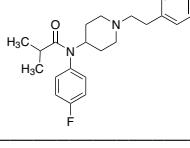

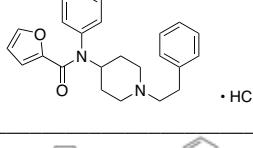

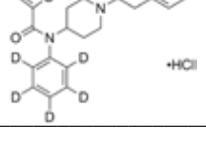

The kits are available free of charge to US laboratories. A requesting lab must have a current DEA registration for Schedule I and II controlled substances and comply with all respective state and local regulations.

Please visit:  
**cerilliant.com**

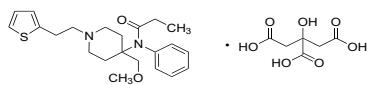

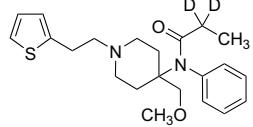

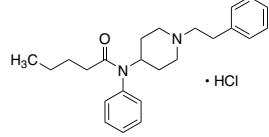

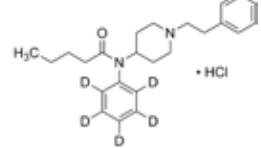

\*Traceable Opioid Material, TOM Kits, and the TOM Kits logo are marks of the U.S. Department of Health and Human Services. The mark 'CDC' is owned by the US Dept. of Health and Human Services and is used with permission. Use of this logo is not an endorsement by HHS or CDC of any particular product, service, or enterprise.

for instructions on how to request a free Opioid CRM Kit. The CDC will review and approve all requests prior to shipment.

## Hallucinogens

Hallucinogens are psychoactive agents that can alter perception, thought, emotion, and consciousness. From plant-based psychoactive substances, phencyclidine (PCP) derivatives, and tryptamines to lysergic acid diethylamide (LSD), hallucinogens - also known as psychedelics - remain popular drugs of abuse widely prevalent around the world. The demand for hallucinogens has expanded as a result of increased availability over the internet and the emergence of new, synthetic hallucinogens which circumvent drug abuse legislation. Psychoactive hallucinogens including Kratom, Salvia divinorum, khat, PCP and its derivatives produce sedating and anesthetizing effects in addition to distorting the sensory perceptions of users. Synthetic substituted tryptamine analogs such as 5-methoxy-DMT, 5-methoxy-DALT, and 5-methoxy-AMT have also become very popular among drug users partly replacing consumption of classical, naturally occurring hallucinogens.

## Immunosuppressants

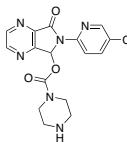

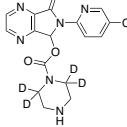

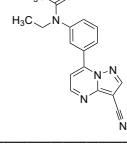

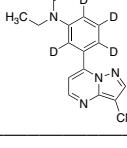

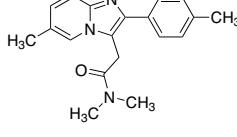

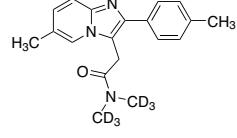

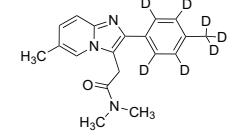

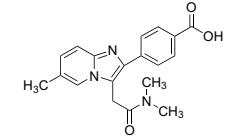

Immunosuppressants or immunosuppressive drugs inhibit or prevent activity of the immune system. Worldwide, the number of organ transplants performed each year continues to increase. Immunosuppressants assist in the long-term survival rates of organ transplant patients by modifying the immune response to minimize rejection of transplanted organs. Clinical testing laboratories play a critical role in supporting long-term survival rates through therapeutic drug monitoring (TDM) of immunosuppressants. TDM assists the physician in maintaining the delicate balance between toxicity and therapeutic levels of immunosuppressant dosing necessary to prevent organ rejection in patients. Many clinical laboratories have adopted LC-MS/MS technology for the quantitation of immunosuppressant levels in patient biological samples due to its improved sensitivity and specificity over immunoassay (IA) techniques. LC-MS/MS immunosuppressant methods offer an additional benefit of eliminating issues with cross reactivity of immunosuppressant metabolites that is common among IA methods.

## Nonbenzodiazepines

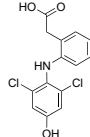

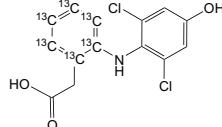

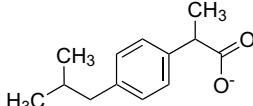

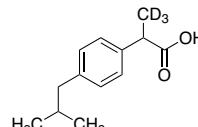

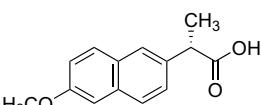

Nonbenzodiazepines, commonly referred to as Z-drugs, represent a widely prescribed class of psychoactive drugs used in the treatment of insomnia. Characterized by rapid onset, these drugs can induce intense sedation, feelings of euphoria, and hallucinations. Use of nonbenzodiazepines, including zolpidem, zopiclone, and zaleplon, can produce side effects such as short-term memory loss, sleepwalking, and sleep driving. Due to involvement in drug facilitated crime, nonbenzodiazepines are analyzed in forensic and clinical toxicology settings. Chromatographic and mass spectrometry-based methods from HPLC to GC/MS, LC/MS, and LC-MS/MS are typically used in screening and confirmatory applications involving nonbenzodiazepines. Analytical methods have been developed that quantify nonbenzodiazepines in whole blood, plasma, and hair for applications ranging from forensic analysis and clinical toxicology to workplace drug testing.

## NSAIDs

Non-steroidal anti-inflammatory drugs (NSAIDs) are a class of pharmaceuticals used in both human and veterinary medicine to treat acute and chronic pain, inflammation, and fever. NSAIDs exert their effects through inhibition of cyclooxygenase (COX), an enzyme that catalyzes the production of prostacyclins or compounds key to the inflammation response. Acute and chronic use of NSAIDs are associated with adverse side effects including gastrointestinal, liver, and renal damage as well as cardiovascular complications. Immunoassays are available for some NSAID medications including acetylsalicylic acid and acetaminophen. For NSAIDs like naproxen, ibuprofen, and indomethacin, immunoassay availability is limited or nonexistent, which is why clinical and forensic analysis of these drugs are typically performed using mass spectrometry-based methods. NSAIDs such as ibuprofen have also been detected as adulterants in food and dietary supplements, and are analyzed by regulatory agencies and quality control laboratories to ensure product quality and potency.

# Opiates

Opiates are naturally occurring alkaloids typically prescribed for the treatment of acute and chronic pain. These drugs have a high addiction potential, are widely available, and potentially lethal when not taken as prescribed. The use of opioids such as hydrocodone, oxycodone and others has been increasing since the late-90s due to over-prescription and their high potential for dependence. The worldwide use and misuse of opiates continues to increase dramatically, and according to the Center for Disease Control and Prevention (CDC) opioid misuse and the emergence of highly potent fentanyl analogues is causing the highest overdose death rates ever recorded in the United States. Stricter regulations, particularly in the US, have increased the need for opioid testing. Opiate analysis has historically been performed using GC/MS, where a typical workflow includes acid or enzyme hydrolysis of opiate glucuronides and derivatization prior to analysis. Today clinical and forensic toxicology labs have been adopting LC-MS/MS over GC/MS for the analysis of opiates due to the technique's increased sensitivity, higher specificity, and reduced time spent on sample preparation.

# Ultra-fast hydrolysis in 15 minutes

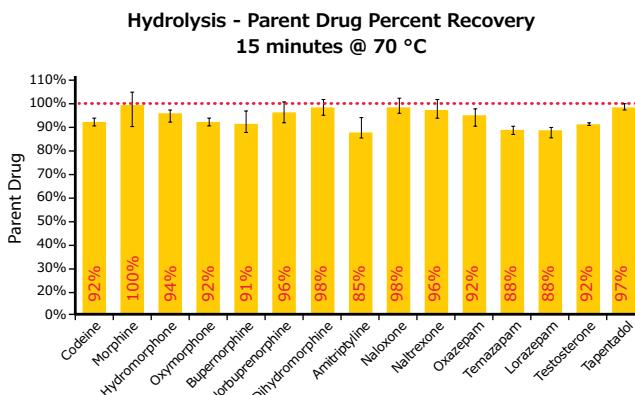

## Increased Efficiency

- High activity allows for 15 min hydrolysis
- Eliminate 6-MAM to Morphine conversion
- >90% hydrolysis of codeine-6-β-D-glucuronide

## Comprehensive Hydrolysis

- Broad efficacy across substrates

## Phosphate-Free Buffer

The first recombinant β-Glucuronidase enzyme formulated without use of phosphate buffer

- Recommended acetate buffer is compatible downstream

## High Stability

- 2-year shelf life with 2-8°C storage
- A representative sample of this product retained 92% activity after storage at 45°C for 28 days

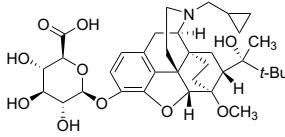

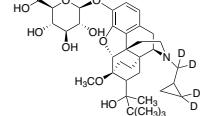

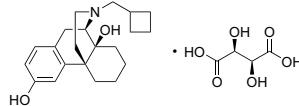

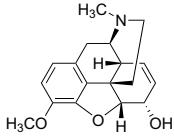

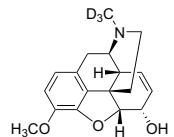

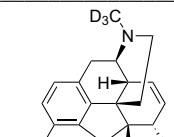

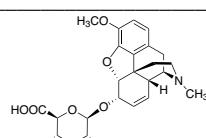

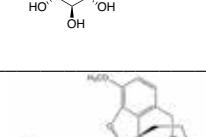

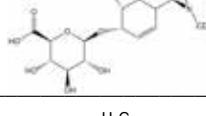

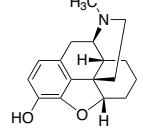

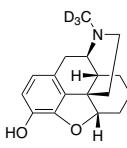

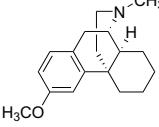

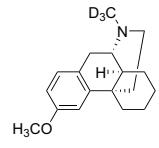

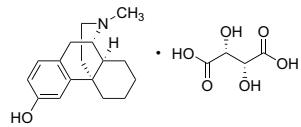

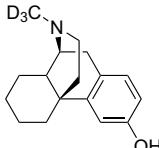

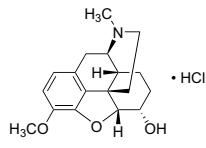

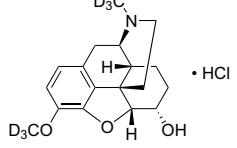

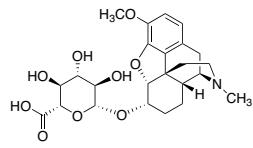

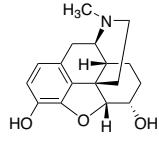

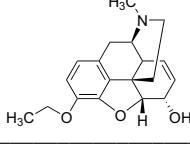

Enzyme is ISO 9001 compliant and manufactured at GMP Sites

## Ascentis® Express UHPLC and HPLC Columns

Designed to deliver speed and resolution

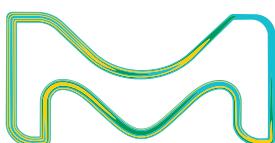

**Millipore**  
**Sigma**

The Fused-Core® technology behind our Ascentis® Express columns delivers maximum speed and efficiency on both UHPLC and HPLC systems.

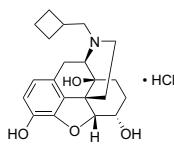

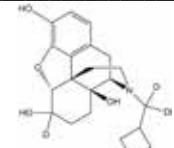

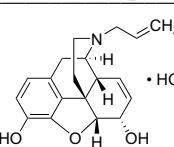

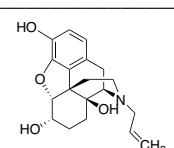

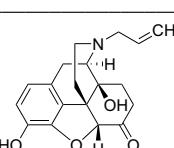

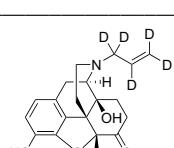

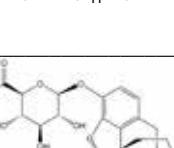

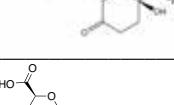

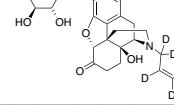

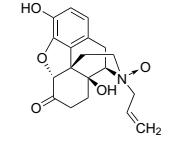

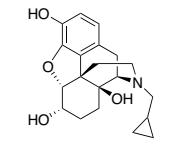

### Key Features and Benefits

- Maximize speed with sharp peaks even at ultra-high flow rates
- More choices for fast HPLC with 2.0, 2.7, and 5.0  $\mu$ m Fused-Core® particles
- Suitable for all UHPLC, HPLC and LC/MS instruments
- New AQ-C18 and C30 phases now available

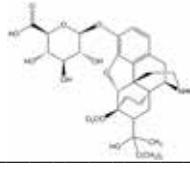

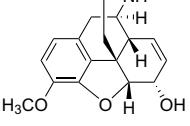

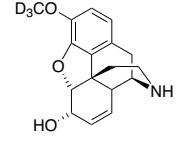

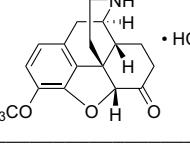

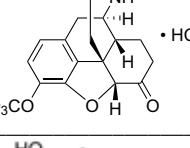

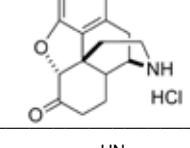

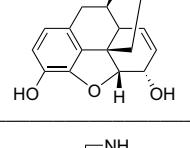

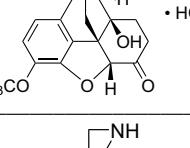

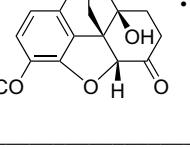

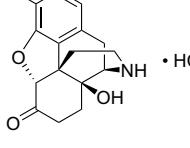

For more information, visit:

# PURE & ULTRAPURE WATER

Milli-Q® IQ 7003/05/10/15 for lab testing applications  
including HPLC, UHPLC and LC-MS

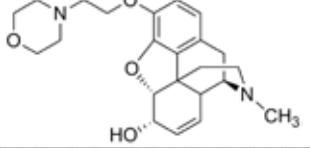

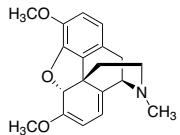

- Superior quality pure & ultrapure water
- Simple & intuitive to use
- Versatile for your current & future needs
- Sustainable design

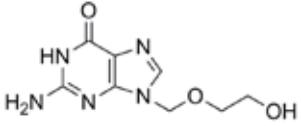

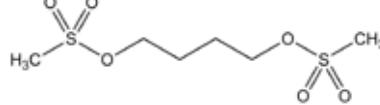

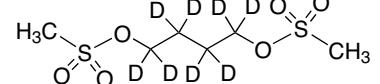

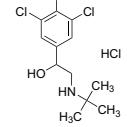

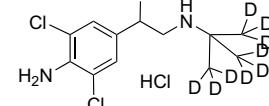

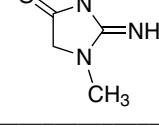

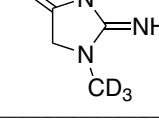

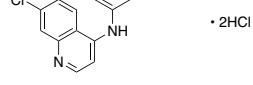

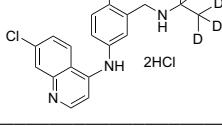

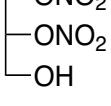

For more information visit

Product Name	ID	Cat. No.	Size	Structure
Zidovudine	30516-87-1 C <sub>10</sub> H <sub>13</sub> N <sub>5</sub> O <sub>4</sub> M.W. 267.24	<b>Z-011-1ML</b>	1.0 mg/mL 1 mL Methanol	 The chemical structure of Zidovudine (Z-011-1ML) is shown. It features a purine ring system with a methoxymethyl group at position 2 and an azido group at position 3. The purine ring is fused to a pyrimidine ring, which has a methyl group at position 4 and a carbonyl group at position 6.

# Pharmaceutical Impurities

Impurities can significantly impact the efficacy and safety of drug products. Accurate detection and control of impurities in drug substances and drug products is an important element of Quality by Design, ICH, and GMP requirements. During manufacture of a drug material, impurities can arise from many different sources including drug substance residual impurities, degradation, extractables and leachables, as well as impurities present in or derived from excipients. Typically, Pharmacopoeial Monographs identify multiple impurities for a given drug substance that require each impurity to be analytically verified by a chromatographic method. Multiple sample preparations are usually required, the process can be a time consuming burden and offer significant opportunity for increased uncertainty and error in the analysis. With our pharmaceutical impurity solution mixes we offer a time efficient, accurate and reproducible option for pharmaceutical analysis.

Product Name	ID	Cat. No.	Size	Structure
Acetaminophen (Paracetamol) Impurity Mixture		A-134-1ML	25 µg/mL ( <i>each analyte</i> ) 1 mL Methanol	
Acetaminophen Impurity Mixture Additional		A-165-1ML	25 µg/mL ( <i>each analyte</i> ) 1 mL Methanol	
4'-Acetoxyacetanilide (Acetaminophen RCA)	2623-33-8 $C_{10}H_{11}NO_3$ M.W. 193.20	A-135-1ML	250 µg/mL 1 mL Acetonitrile	
4-Chloroacetanilide (Acetaminophen RCJ)	539-03-7 $C_8H_7NO \cdot HCl$ M.W. 169.61	C-166-1ML	250 µg/mL 1 mL Acetonitrile	
4-Aminophenol (Acetaminophen RCK)	123-30-8 $C_6H_7NO$ M.W. 109.13	A-136-1ML	250 µg/mL 1 mL Acetonitrile	
Aspirin Impurity Mixture		A-143-1ML	100 µg/mL ( <i>each analyte</i> ) 1 mL Acetonitrile	
Acetylsalicylic Anhydride (Aspirin Impurity F)	1466-82-6 $C_{16}H_{14}O_7$ M.W. 342.30	A-155-1ML	100 µg/mL 1 mL Acetonitrile	
Atorvastatin Impurity Mixture		A-151-1ML	50 µg/mL ( <i>each analyte</i> ) 1 mL Methanol	
Bupropion Impurity Mixture		B-082-1ML	100 µg/mL ( <i>each analyte</i> ) 1 mL Methanol	
Bupropion System Suitability Mix		B-069-1ML	12-20 µg/mL 1 mL 80:20 0.001N HCl:Methanol	
Caffeine Impurity Mixture		C-175-1ML	0.04-2.0 mg/mL 1 mL 50:50 Acetonitrile:Water	
6-Amino-1,3-dimethyl-5-(formylamino) uracil (Caffeine Imp B)	7597-60-6 $C_7H_{10}N_4O_3$ M.W. 198.18	C-194-1ML	40 µg/mL 1 mL 50:50 ACN:Water

Thiamine Impurity Mixture		T-134-1ML	100 µg/mL ( <i>each analyte</i> ) 1 mL Methanol:1% Acetic Acid 50:50	

# Accelerating hydrolysis efficiency

**Hydrolyze your compounds with our non-recombinant and recombinant  $\beta$ -Glucuronidase enzymes**

Glucuronidation, conjugation with glucuronic acid, by the human UDP-glucuronosyltransferase (UGT) family of enzymes plays an important role in the metabolic fate of many drugs and other xenobiotics. Enzymatic hydrolysis is often a crucial step in order to cleave these glucuronidated compounds and allow them to be more amenable for downstream analysis in toxicology testing.

## Extensive range of $\beta$ -Glucuronidase enzymes include:

- Both recombinant and non-recombinant enzymes, including those with various sulfatase levels to optimize your hydrolysis
- Many sources and purified options:
  - **Molluskan**
  - **Bovine Liver**
  - **E. Coli**

## Phenethylamines

Phenethylamines possess stimulant and hallucinogenic effects and are classified as entactogens, psychoactive molecules enhancing empathy and feelings of emotional closeness. Phenethylamines are synthetic compounds, commonly known as party pills, acting on serotonin receptors and in some cases also inhibiting monoamine reuptake, leading to psychedelic effects. During the last few years, increased use of new phenethylamine derivatives on the recreational drug scene has been observed, including ring-substituted molecules such as the 2C series, Bromo-DragonFly and 2C-B-Fly. Several cases of intoxications resulted in symptoms and side effects including hypertension, hyperthermia, convulsions, dissociation, hallucinations, respiratory deficits, liver and kidney failure, and death in case of overdose.

# Proteins

Quantitative LC-MS/MS or MALDI-MS protein testing applications have greatly contributed to the maturation of quantitative proteomics due to its high sensitivity and specificity in various fields such as Pharma, Clinical and Food regulation testing. As proteins are identified as important biomarkers of disease, the use of quantitative LC-MS/MS assays to screen proteins that are diagnostic for disorders has greatly increased in recent years. Cerilliant® fully intact Protein Certified Reference Materials for diagnostic testing, pharmaceutical release testing and food safety testing are used as reference standards in qualitative and quantitative LC-MS/MS applications to guarantee accurate and reproducible results.

## BIOshell™ Fused-Core® Columns

Faster Separation of Proteins, Peptides, and Glycans

BIOshell™ columns are the most recent innovation in Fused-Core® particle technology:

### Features and benefits:

- Maximum speed and high efficiency with U/HPLC columns for protein, peptide, and glycan separations
- Novel, superficially porous silica particles (SPP), with pore sizes ranging from 90 Å up to 1000 Å

## Skeletal Muscle Relaxants (Non-Benzodiazepine)

Skeletal muscle relaxants, such as carisoprodol, cyclobenzaprine, baclofen, and metaxalone, are prescribed to alleviate musculoskeletal pain and spasms. Consumption of muscle relaxants can produce effects similar to analgesics including drowsiness, dizziness, and impaired judgment. These drugs exhibit a high abuse potential, and subsequently, are controlled in many parts of the world from various EU member countries, to the United States and Canada. Drug abusers often combine muscle relaxants with other drugs such as alcohol, heroin, benzodiazepines, or prescription opioids to enhance their effects.

## Steroids/Hormones

Steroids comprise a diverse group of cell signaling molecules that have therapeutic efficacy in the treatment of diseases including osteoporosis, inflammation, anemia, sexual dysfunction, and the rebuilding of muscles after a debilitating disease. Besides pharmaceutical use, steroids are often used illicitly to increase strength and lean muscle mass and to boost athletic performance.

Hormones are endogenous biomarkers that control, regulate, and influence the activity of complex physiological processes such as metabolism, growth, and fertility. Major hormone categories listed include corticosteroids, glucocorticoids, and sex hormone classes such as estrogens, progestogens, and androgens. Hormone testing has increased significantly in the clinical laboratory setting in the past as advances in the specificity and selectivity of LC-MS/MS technology have enabled hormones to serve as indicators for a variety of diseases from congenital disorders, heart disease, and psychiatric illnesses to numerous cancers. Newborn screening (NBS) of hormones, for example, is routinely performed by LC-MS/MS to aid in the diagnosis of congenital adrenal hyperplasia (CAH), genetic disorders affecting the adrenal glands. Hormone testing has also expanded to include personalized health markets, where hormone panels are marketed for comprehensive ‘wellness’ screens or ‘anti-aging’ diagnostics. Apart from their use in established clinical and diagnostic testing applications, hormones have shown efficacy in the treatment and diagnosis of severe pain. Pain management clinics have increasingly incorporated hormone testing protocols to determine a patient’s degree of pain, and whether hormone replacement therapy is required as a part of pain reduction strategies.

# Testosterone & Estrogen CRMs in Serum

In-matrix Calibrators for Clinical Research  
Mass Spectrometry Applications by LC-MS/MS

## Features and Benefits:

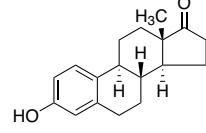

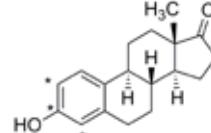

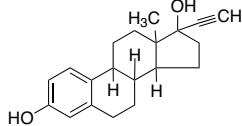

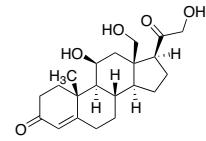

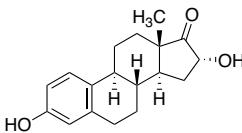

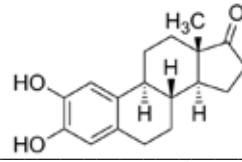

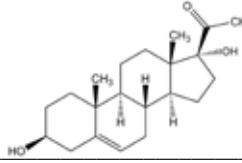

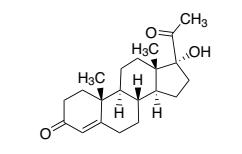

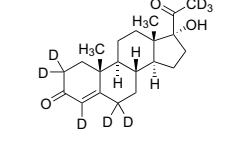

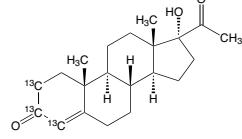

- Individual levels ranging from 4 to 2,000 ng/dL for testosterone and 10 to 1,000 pg/mL for estrogens
- Ready-to-use as linearity standards or for calibration verification
- CRM grade – High accuracy of concentration
- Ready-to-use – Reduces labor & cost eliminates preparation step as source of error
- Matrix-matched format – Compensates for matrix effects
- Stability pre-determined – Supported with real-time data
- Serum blank and <sup>13</sup>C- or deuterium-labeled internal standards are also available

For more information, please visit:

# quality means trust

**SigMatrix and SigMatrix Ultra Animal Free Serum Diluents for Enhanced Clinical Accuracy**

Ideal synthetic matrix for samples, standards, controls and calibrants in ELISA and LC/MS based applications.

#### Key Product Features

- Significantly lower endogenous hormones and interferences compared to stripped serums and human albumins
- Recombinant HSA-Based Formulation
- Improve the inter and intra assay precision in your lab

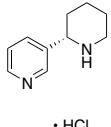

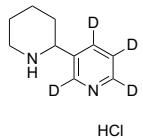

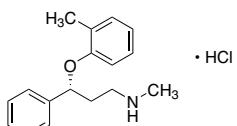

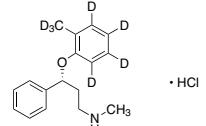

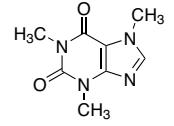

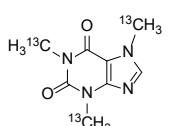

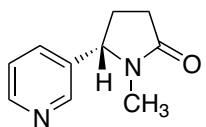

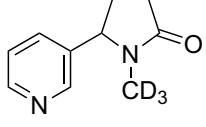

For more information on our synthetic matrices, visit:

## Stimulants (Non-Amphetamine)

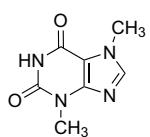

Stimulants such as nicotine, caffeine and their derivatives promote increased wakefulness, endurance, and alertness. Side effects of some stimulants can include anxiety, insomnia, fatigue, and in some instances, neurotoxicity. With over 1 billion estimated cigarette smokers, nicotine is among the most widely used stimulants in the world. Recently, electronic nicotine inhalers known as e-cigarettes have expanded in popularity across Europe and North America as an alternative to traditional cigarettes.

Product Name	ID	Cat. No.	Size	Structure
Theobromine	83-67-0 C <sub>7</sub> H <sub>8</sub> N <sub>4</sub> O <sub>2</sub> M.W. 180.16	T-013-1ML	100 µg/mL 2 mL Methanol	 The chemical structure of Theobromine is shown as a purine derivative. It features a fused four-membered imidazole ring and a six-membered purine ring. The imidazole ring has two methyl groups (CH <sub>3</sub> ) at the 2 and 6 positions. The purine ring has an amino group (NH) at position 4 and a carbonyl group (C=O) at position 6.

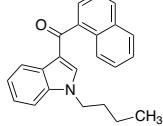

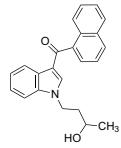

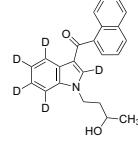

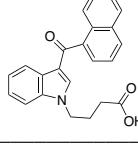

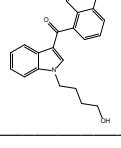

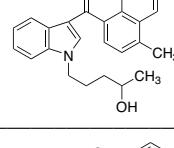

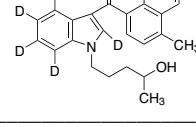

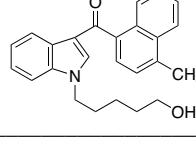

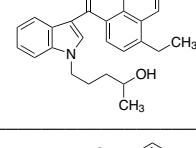

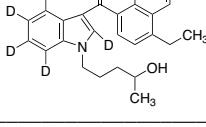

## Synthetic Cannabinoids

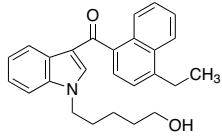

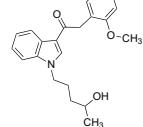

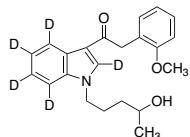

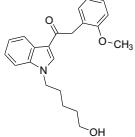

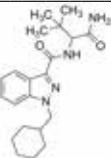

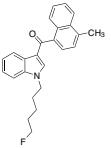

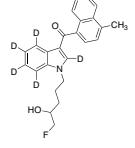

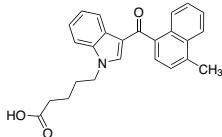

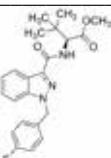

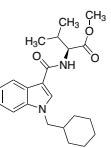

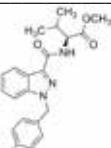

Synthetic cannabinoids mimic the effect of natural cannabinoids found in cannabis plants, such as Δ<sup>9</sup>-tetrahydrocannabinol (THC), and are designed specifically to circumvent drug control legislation. These drugs are typically smoked by pipe, rolled in cigarette paper, ingested, or inhaled and can produce intense psychological and physiological effects including auditory and visual hallucinations, anxiety, and euphoria. They are associated with an increased risk of mortality as a result of the higher affinity for CB<sub>1</sub> and CB<sub>2</sub> cannabinoid receptors, and the longer-lasting and more adverse effects of synthetic cannabinoids compared to marijuana. Synthetic cannabinoids appeared for the first time in the European market in 2004 and soon started spreading worldwide under different brand names such as Spice, K2, K3, Smoke. Within the last decade, synthetic cannabinoids have grown to be one of the most widely abused drug classes worldwide, including some of the most routinely tested and newly appearing synthetic cannabinoids such as JWH-018, JWH-073, AM-2201, MMB-FUBINACA (FUB-AMB), 5F-MDMB-PINACA, ADB-FUBINACA, MMB-CHMICA, AB-FUBINACA. Synthetic cannabinoids are routinely analyzed using GC/MS and LC/MS methods in forensic and clinical toxicology applications including postmortem, urine, and confirmatory drug testing.

# Thyroid Hormones

Thyroid hormones are two hormones produced and released by the thyroid gland, namely triiodothyronine ( $T_3$ ) and thyroxine ( $T_4$ ). They are tyrosine-based hormones that are primarily responsible for regulation of metabolism. Thyroid hormones act on nearly every cell in the body regulating protein, fat, vitamin and carbohydrate metabolism, affecting how human cells use energetic compounds. The major form of thyroid hormone in the blood is  $T_4$ , which is enzymatically converted to the active  $T_3$  within cells. The amount of  $T_4$  produced by the thyroid gland is controlled by a protein hormone called thyroid stimulating hormone (TSH). Blood tests to measure TSH,  $T_4$ ,  $T_3$  and free  $T_4$  are widely used to diagnose thyroid hormone related disorders. Hypothyroidism (underactive thyroid) and hyperthyroidism (overactive thyroid) are the most common thyroid disorders. Common causes of these disorders include the immune system disorder Graves' disease, for hyperthyroidism, and Hashimoto's disease, for hypothyroidism. Further symptoms such as depression, loss of hair and neurodevelopmental disorders can be caused by excess or deficiency of thyroxine.

## Vitamins

Vitamins including isoforms of A, B, C, D, E and K, as well as cofactors such as Coenzyme Q<sub>10</sub> play vital functions in cellular metabolism from lipid, hormone, and enzyme production to intra- and extracellular transport and gene expression. Deficiencies in vitamins can lead to the development of chronic diseases such as anemia, cardiovascular disease, and cancer. Clinical screening of vitamins or their metabolic analogs by HPLC or LC-MS/MS is routinely performed to assess potential vitamin deficiencies in neonates, pregnant women, and the elderly as well as among adult men and women. The US Food and Drug Administration (FDA) requires manufacturers of vitamin dietary supplements to establish an identity specification for each component used in the manufacturing of dietary supplements. The main methods currently used for vitamin dietary supplement testing include TLC, HPTLC, and HPLC. The use of LC-MS/MS methods for food and dietary supplement testing has increased due to its high sensitivity and throughput, reduction in sample treatment steps compared with other techniques such as GC/MS, and its lower limits of quantitation. The development of analytical methods for vitamins can be challenging due to the sensitivity many vitamins have to air, light and solution pH. Water-soluble vitamins such as riboflavin and vitamin B<sub>6</sub>, for example, degrade rapidly when exposed to light, and exhibit varying degrees of sensitivity to solution pH. These vitamin specific challenges, if unaddressed during method development, have the potential to reduce the accuracy and precision of the end use testing application.

# Reduce Ion Suppression Without Reducing Throughput

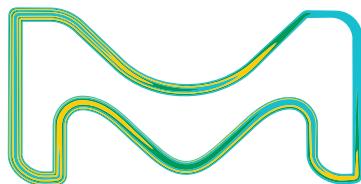

HybridSPE®-Phospholipid (HybridSPE®-PL) technology combines the simplicity of protein precipitation with the selectivity of solid phase extraction (SPE) for the targeted removal of phospholipids in biological plasma/serum.

## Features and Benefits:

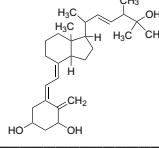

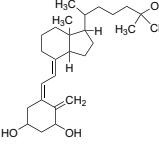

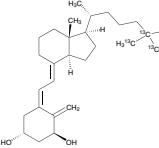

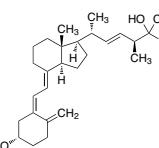

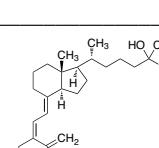

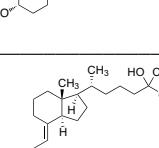

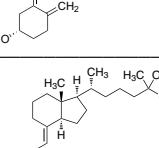

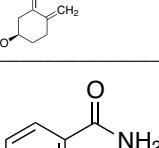

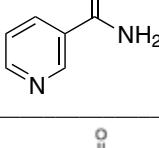

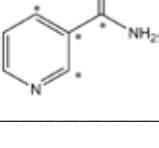

- Performs well for both hydrophobic and hydrophilic compounds, unlike competitive product chemistries
- The phospholipid retention mechanism is based on a selective Lewis acid-base interaction between the proprietary zirconia ions
- Simple, 2-3 step procedure with minimal to no method development required
- Formats Available: 96-well, dispersive 96-well tip (DPX™), cartridges and on-line SPE (Supel Genie)

## Weight-Loss Drugs (Non-Amphetamine)

Amine and phenethylamine derivatives such as ephedrine, phentermine, fenfluramine, and sibutramine are central nervous system (CNS) stimulants historically marketed as weight-loss drugs, decongestants, and athletic performance enhancers. Internationally, these substances are available only through a doctor's prescription due to severe, adverse health effects associated with their use including tachycardia, stroke, seizure and psychosis. These drugs frequently appear in counterfeit medicines in products marketed as alternatives to street drugs, and as adulterants in dietary and herbal supplements. In order to ensure consumer safety, regulatory agencies in Europe, Canada, and the United States prohibit the distribution of dietary supplements adulterated with ephedrine or other pharmaceutical compounds. Despite these regulations, amine and phenethylamine derivatives are frequently identified in food and dietary supplements.

Acetaminophen-D <sub>4</sub>	23
Acetaminophen Impurity Mixture Additional	124
Acetaminophen (Paracetamol) Impurity Mixture	124
4'-Acetoxyacetanilide (Acetaminophen RCA)	124
6-Acetylcodeine	107
Acetyl fentanyl	93
Acetyl fentanyl- <sup>13</sup> C <sub>6</sub>	93
6-Acetylmorphine	107
6-Acetylmorphine-D <sub>3</sub>	107
6-Acetylmorphine-D <sub>6</sub>	107
Acetyl norfentanyl- <sup>13</sup> C <sub>6</sub> oxalate	93
Acetyl norfentanyl oxalate	93
N-Acetylretigabine	31
Acetylsalicylic Anhydride (Aspirin Impurity F)	124
Acryl fentanyl-D <sub>5</sub> HCl	95
Acryl fentanyl HCl	93
Acyclovir	120
Acylcarnitines	12
Acylcarnitines IS Mix 1 (C0,C2)	12
Acylcarnitines Mix 1 (C0,C2)	12
ADB-FUBINACA	147
AH-7921-D <sub>3</sub> HCl	23
AH-7921 HCl	23
α-Hydroxytriazolam-D <sub>4</sub>	9
Alcohol Standards	13
Aldosterone	134
Alfentanil HCl	95
Alprazolam	9, 10, 57
Alprazolam-D <sub>5</sub>	57
AM2201 4-Hydroxypentyl metabolite	147
AM2201 4-Hydroxypentyl metabolite-D <sub>5</sub> (indole-D <sub>5</sub> )	147
Amine Mixture-6	9
Aminorex	160
6-Amino-1,3-dimethyl-5-(formylamino) uracil (Caffeine Imp B)	124
Amiodarone-D <sub>4</sub> HCl	75
Amiodarone HCl	75
7-Aminoclonazepam	57
7-Aminoclonazepam-D <sub>4</sub>	9, 57
7-Aminoflunitrazepam	57
7-Aminoflunitrazepam- <sup>13</sup> C <sub>6</sub>	58
7-Aminoflunitrazepam-D <sub>7</sub>	9, 57
7-Aminonimetazepam	58
7-Aminonitrazepam	58
7-Aminonitrazepam-D <sub>5</sub>	58
4-Aminophenol (Acetaminophen RCK)	124
Amitriptyline-D <sub>3</sub> HCl	36
Amitriptyline HCl	36

Amitriptyline N-β-D-glucuronide	36
Amlodipine besylate	10
Amobarbital	9, 54
Amobarbital-D <sub>5</sub>	54
Amoxapine	36
Amoxapine-D <sub>8</sub>	36
Amphetamines	17
(±)-Amphetamine	9, 17
(±)-Amphetamine-D <sub>6</sub>	18
(±)-Amphetamine-D <sub>8</sub>	18
(±)-Amphetamine-D <sub>5</sub> (deuterium label on ring)	17
(±)-Amphetamine-D <sub>5</sub> (deuterium label on side chain)	17
(±)-Amphetamine-D <sub>10</sub>	17
(±)-Amphetamine-D <sub>11</sub>	17
S(+)-Amphetamine (dextro-Amphetamine)	17
R(-)-Amphetamine (levo-Amphetamine)	17
(+)-Anabasine HCl	141
Anabasine-D <sub>4</sub> HCl	141
Analgesics (Non-Opiates)	23
Androstene-3,17-dione-2,3,4- <sup>13</sup> C <sub>3</sub>	134
Androstenedione	134
Androsterone-D <sub>4</sub> glucuronide	134
Anesthetics	29
Anhydroecgonine methyl ester	89
Anticonvulsants/Antiepileptics	31
Antifungals	45
Antihistamines	47
Antipsychotics	49
4-ANPP	95
4-ANPP-D <sub>5</sub>	95
APINACA (AKB-48)	147
APINACA (AKB-48) 5-Hydroxypentyl metabolite	147
APINACA (AKB-48) 5-Hydroxypentyl metabolite-D <sub>4</sub>	147
Aprobarbital	54
Arachidonic acid (cis-5,8,11,14)	92
Aripiprazole	10, 49
Aripiprazole-D <sub>8</sub>	49
Ascomycin	102
Asenapine-D <sub>3</sub> maleate	49
Asenapine maleate	49
Aspirin Impurity Mixture	124
Atenolol	75
Atomoxetine-D <sub>7</sub> HCl	141
Atomoxetine HCl	141
Atorvastatin Calcium salt	10
Atorvastatin Impurity Mixture	124
Atropine	75
Azithromycin	10
<b>B</b>	
Baclofen	131
(±)-Baclofen-D <sub>4</sub>	131
Barbital	54
Barbiturate Mix-5	9
Barbiturates	54
BB-22	147
BB-22 3-carboxyindole metabolite	147

Benzodiazepine Internal Standard-3	9	Cannabinol	72
Benzodiazepine Multi-Component Mixture-8	9	Cannabinol-D <sub>3</sub>	72
Benzoylecgonine	9, 89	Cannabinolic Acid (CBNA)	72

Pentylone-D <sub>3</sub> HCl	86	(±)-Propranolol-D <sub>7</sub> (ring-D <sub>7</sub> )	77
Pentylone HCl	85	Propranolol HCl	76
Perampanel-D <sub>4</sub>	33	Protriptyline-D <sub>3</sub> HCl	42
Perphenazine	42	Protriptyline HCl	42
Perphenazine-D <sub>8</sub>	42	Pseudoephedrine-D <sub>3</sub> hydrochloride	22
PEth 16:0/18:1	15	(1R,2R)-(-)-Pseudoephedrine	11
PEth 16:0/18:1-D <sub>5</sub>	15	R,R-( )-Pseudoephedrine	10
		R,R-( )-Pseudoephedrine	22
		S,S(+)-Pseudoephedrine	22

Psilocin	101	Sufentanil-D <sub>5</sub>	98
Psilocin-D <sub>10</sub>	101	Suvorexant-D <sub>6</sub>	122
Psilocybin	101		
Psilocybin-D <sub>4</sub>	101		
Pyrazolam	66	Tacrolimus	103
Pyridoxal 5'-phosphate	157	Tadalafil	122
Pyridoxine Impurity Mixture	125	Tapentadol-D <sub>3</sub> HCl	27
Pyrovalerone HCl	86	Tapentadol-D <sub>3</sub> -β-D-glucuronide	27
α-Pyrrolidinobutiophenone HCl (α-PBP HCl)	86	Tapentadol HCl	26
α-Pyrrolidinopropiophenone HCl (α-PPP HCl)	86	Tapentadol-O-sulfate	27
α-Pyrrolidinovalerophenone-D <sub>8</sub> HCl (α-PVP-D <sub>8</sub> HCl)	86	Tapentadol-β-D-glucuronide	26
α-Pyrrolidinovalerophenone HCl (α-PVP HCl)	86	Taurocholic acid sodium salt	70
		Temazepam	9, 66
<b>Q</b>		Temazepam-D <sub>5</sub>	66
Quazepam	66	Temazepam glucuronide lithium salt	66
Quetiapine carboxylic acid	52	Teriflunomide	103
Quetiapine carboxylic acid-D <sub>8</sub>	52	Teriflunomide-D <sub>4</sub>	103
Quetiapine-D <sub>8</sub> hemifumarate	52	Testosterone	140
Quetiapine fumarate	52	Testosterone-2,3,4- <sup>13</sup> C <sub>3</sub>	140
		Testosterone CRM in Serum, 4 ng/dL, 1mL	87
<b>R</b>		Testosterone CRM in Serum, 52.5 ng/dL	87
Remifentanil acid	97	Testosterone CRM in Serum, 750 ng/dL	87
Remifentanil HCl	97	Testosterone CRM in Serum, 2000 ng/dL	87
Retigabine	34	Testosterone-D <sub>3</sub> (16,16 17-D <sub>3</sub> )	140
Retigabine-D <sub>4</sub>	34	Testosterone Serum Blank	87
Retinol (Vitamin A)	157	Δ <sup>9</sup> -Tetrahydrocannabinolic acid A (THCA-A)	74
Retinyl acetate (Vitamin A acetate)	157	Tetrahydrocannabivarinic Acid (THCVA)	74
Retinyl palmitate (Vitamin A palmitate)	157	Tetrahydrocannabivarin (THCV)	74
Riboflavin Impurity Mixture	125	Tetrazepam	66
(-)Riboflavin- <sup>13</sup> C <sub>4</sub> , <sup>15</sup> N <sub>2</sub> (Vitamin B <sub>2</sub> - <sup>13</sup> C <sub>4</sub> , <sup>15</sup> N <sub>2</sub> )	157	exo-THC	74
(-)Riboflavin (Vitamin B <sub>2</sub> )	157	THC Cannabinoids Mixture-3	11
Risperidone	52	(-)-Δ <sup>8</sup> -THC	73
Risperidone-D <sub>4</sub>	52	(-)-Δ <sup>9</sup> -THC	73
Ritalinic acid HCl	144	(-)-Δ <sup>9</sup> -THC-D <sub>3</sub>	73
(±)-threo-Ritalinic acid-D <sub>4</sub> HCl	144	(±)-Δ <sup>9</sup> -THC	73
(±)-threo-Ritalinic acid-D <sub>10</sub> HCl	144	Thebaine	119
Rivastigmine Impurity Mixture	125	Theobromine	77, 145
Rufinamide	10, 34	Thiamine- <sup>13</sup> C <sub>3</sub> HCl (Vitamin B <sub>1</sub> - <sup>13</sup> C <sub>3</sub> )	158
		Thiamine HCl (Vitamin B <sub>1</sub> )	158
<b>S</b>		Thiamine Impurity Mixture	126
Salicylic acid	10	Thiamine pyrophosphate (Vitamin B <sub>1</sub> pyrophosphate)	158
Salicylic Acid Impurity Mixture	126	Thioridazine	53
Salvinorin A	101	Thioridazine-D <sub>3</sub> HCl	53
(-)Scopolamine-D <sub>3</sub> HCl	101	TH-PVP HCl	86
(-)Scopolamine HBr	101	Thyroglobulin	130
SDB-005	151	L-Thyroxine- <sup>13</sup> C <sub>6</sub> (T <sub>4</sub> - <sup>13</sup> C <sub>6</sub> )	153
Secobarbital	9, 56	L-Thyroxine (T <sub>4</sub> )	153
Secobarbital-D <sub>5</sub>	56	Tiagabine-D <sub>6</sub> HCl	34
R(-)-Selegiline [(-)-Deprenyl]	43	Tiagabine HCl	34
Sertraline-D <sub>3</sub> HCl	43	Tilidine-D <sub>6</sub> HCl	27
Sertraline HCl	10, 43	Tilidine HCl	27
Sibutramine HCl	161	Tizanidine-D <sub>4</sub> HCl	133
Sildenafil	122	Tizanidine HCl	133
Simvastatin	10	(+)-γ-Tocopherol (Vitamin E)	158
Sirolimus-D <sub>3</sub>	103	(±)-α-Tocopherol-D <sub>6</sub> (Vitamin E-D <sub>6</sub> )	158
Sirolimus (Rapamycin)	103	(±)-α-Tocopherol (Vitamin E)	158
Spice Cannabinoid Mix	11	(±)-γ-Tocopherol-D <sub>3</sub>	158
Spice Cannabinoid Mix 2	11	Tocopherol acetate (Vitamin E acetate)	158
Spice Cannabinoid Mix 3	11	Topiramate	10, 34
Stanozolol	140	Topiramate-D <sub>12</sub>	34
Sufentanil citrate	98	cis-Tramadol- <sup>13</sup> C,D <sub>3</sub> HCl	27
		cis-Tramadol HCl	11, 27

Trazodone-D <sub>6</sub> HCl	43
Trazodone HCl	43
Trenbolone	140
Triazolam	66
Triazolam-D <sub>4</sub>	67
3-Trifluoromethylphenyl piperazine (TFMPP)-D <sub>4</sub> HCl	68
3-Trifluoromethylphenyl piperazine (TFMPP) HCl	68
Trifluoperazine diHCl	53
Trifluoperazine N-β-D-glucuronide	53
Triflupromazine HCl	53
3,3',5'-Triiodo-L-thyronine- <sup>13</sup> C <sub>6</sub> (reverse T <sub>3</sub> - <sup>13</sup> C <sub>6</sub> )	153
3,3',5-Triiodo-L-thyronine- <sup>13</sup> C <sub>6</sub> (T <sub>3</sub> - <sup>13</sup> C <sub>6</sub> )	153
3,3',5'-Triiodo-L-thyronine (Reverse T <sub>3</sub> )	153
3,3',5-Triiodo-L-thyronine (T <sub>3</sub> )	153
Trimipramine	43
Trimipramine-D <sub>3</sub> maleate	43
Trinitroglycerin	122
<b>U</b>	
U-47700	27
U-47700-D <sub>3</sub>	27
U-48800-D <sub>3</sub> HCl	28
U-48800 HCl	28
U-50488 mesylate	28
U-51754-D <sub>3</sub> HCl	28
U-51754 HCl	28
UR-144	151
UR-144 5-Hydroxypentyl metabolite	151
UR-144 5-Hydroxypentyl metabolite-D <sub>5</sub> (indole-D <sub>5</sub> )	151
UR-144 5-Pentanoic acid metabolite	152
UR-144 5-Pentanoic acid metabolite-D <sub>5</sub> (indole-D <sub>5</sub> )	152
Ursodeoxycholic acid	70
Ursodeoxycholic acid-D <sub>4</sub>	70
<b>V</b>	
Valeryl fentanyl-D <sub>5</sub> HCl	98
Valeryl fentanyl HCl	98
Valproic acid	10, 34
Valproic acid-D <sub>6</sub>	34
(±)-Vanilmandelic acid	9
Vardenafil diHCl	122
Venlafaxine-D <sub>6</sub> HCl	43
Venlafaxine hydrochloride	43
Verapamil HCl	77
Vigabatrin	10, 35
Vilazodone-D <sub>4</sub> HCl	43, 44
Vitamin D <sub>2</sub>	158
D <sub>3</sub> -Vitamin D <sub>2</sub> (6,19,19-D <sub>3</sub> )	158
Vitamin D <sub>3</sub>	159
Vitamin K <sub>1</sub>	159
Vitamin K <sub>1</sub> - <sup>13</sup> C <sub>6</sub>	159
Vitamin K <sub>2</sub> (MK-4)	159
Vitamin K <sub>2</sub> (MK-4)- <sup>13</sup> C <sub>6</sub>	159
Vitamin K <sub>2</sub> (MK-7)	159
Voriconazole	46
(±)-Voriconazole-D <sub>3</sub>	46
<b>W</b>	
W-18	28
W-18-D <sub>4</sub>	28
Warfarin	10, 77
<b>X</b>	
XLR-11	152
XLR-11 4-Hydroxypentyl metabolite	152
XLR-11 4-Hydroxypentyl metabolite-D <sub>5</sub> (indole-D <sub>5</sub> )	152
<b>Y</b>	
<b>Z</b>	
Zaleplon	104
Zaleplon-D <sub>4</sub>	104
Zidovudine	123
Ziprasidone HCl	53
Zolazepam HCl	67
Zolpidem	104
Zolpidem-D <sub>6</sub>	104
Zolpidem-D <sub>7</sub>	104
Zolpidem phenyl-4-carboxylic acid	104
Zolpidem phenyl-4-carboxylic acid-D <sub>4</sub>	105
Zolpidem tartrate	10
Zonisamide	10, 35
Zonisamide- <sup>13</sup> C <sub>6</sub>	35
Zopiclone	105
Zopiclone-D <sub>4</sub>	105
Zopiclone-N-oxide	105
Zopiclone-N-oxide-D <sub>4</sub>	105
