

Design Makes The Difference

Formex **Ultimate** Permanent Island Forms – offering advanced design with construction components that make installations go faster and finished islands more pleasing and professional in appearance.

Formex **Ultimate** Permanent Island Forms enjoy the reputation as the most advanced steel island forms available. Some features are listed below:

- Shorter end sections designed to give more room for larger containment systems.
- Bracing welded so as not to interfere with canopy columns.
- Forms include a 1" return on the straight sides to make islands more rigid.
- Sturdy 1" angle cross braces support the weight of heavier containment systems.
- Contractors will no longer have to cut out bracing in the field.
- Raised ends will be made in one piece with heights up to 36".
- Components are smaller and require less room to store. Also are cheaper to ship.
- Same end components are used for Dogbone islands as are used for straight islands.

- Heavy 12-gauge (1/8") prime steel plate construction. (Available prime coated, galvanized, or stainless steel.)

The nut on the adjustable "J" bolt is on the top side making assembly easier and faster.

Extra angle on island sides provide added strength. Also serve to anchor cross braces.

Bottom Flange is 1" wide for greater strength and holds form true and straight.

Joint line up Pins permit fast and accurate alignment.

Double Bracing on every island. Adjustable top braces permit easier placement of dispenser boxes, light or canopy poles. Bottom braces bolt to flanges for stronger assembly.
