

## PRP PROCEDURE

### How does the procedure work?

After you check-in, our medical assistant will take a blood sample. Your blood sample is spun on a special centrifuge that concentrates the platelets in your plasma. This platelet rich plasma is drawn off into a sterile syringe. In addition to platelets, the plasma has a host of growth factors and stimulators for the stem cells.

Next, the medical doctor will inject tiny amounts of PRP in the areas where hair growth is desired. After this procedure you may return to all normal activities and showering. The doctor may also recommend topical Minoxidil to further help stimulate hair growth.

For most patients, PRP therapy is repeated 4 times at monthly intervals.

### How does PRP (platelet rich plasma) work?

PRP (platelet rich plasma) therapy works on the stem cells that grow hair. Human blood contains growth factors and stem-cell stimulators that turn "on" stem cells to regenerate hair growth. Once the stem cells are stimulated then non-active hair follicles begin growing hair again.

PRP therapy for hair growth has been a topic in dermatologic medicine literature in Europe and the United States. Not only is this technique revolutionary in hair regrowth, it is also one of the safest aesthetic procedures on the market today.

Besides its use in hair restoration, PRP is being used in orthopedic medicine for joint injury recovery for athletes, in oral surgery and neurosurgery.

## PRP Hair Restoration

Finally, a non-invasive, state of the art solution to reverse hair loss in men & women

BeWell.

## Aesthetic Services @ Be Well.

Laser Skin Rejuvenation  
Fillers & Lifting Threads  
Smoothing Threads  
Newtox/Dysport  
Laser Hair Removal  
Laser Body Contouring

### How Effective is PRP for hair restoration?

Of all products on the market for non-invasive hair restoration, PRP is the most effective. Results do vary and there is no guarantee of success for all candidates.

### Candidates for PRP Treatment

The best candidates for PRP treatment are those who do not have a history of alopecia areata or scarring alopecia. If you are unsure what type of hair loss that you have, please make a consultation appointment to determine if you are a candidate for PRP hair restoration.

### The Science of PRP Hair Growth

PRP, platelet rich plasma, contains platelets that contain growth factors that in turn stimulate follicle stem cells to grow hair. Additionally, platelets accelerate the rate and degree of hair regeneration so that hair growth exceeds hair loss. PRP awakens inactive hair follicles, causing them to revert to the growth phase (anagen).

### Is PRP a permanent solution?

Yes, PRP for hair restoration is a permanent way to grow back hair. Most patients require annual maintenance to further grow hair and support the new hair. Some patients continue to need topical minoxidil to enhance full hair growth.
