

RISK: Wallace's Gap Road 10,000+ panel solar farm proposal – WATER POLLUTION

- Our group's goal is to protect the environment both on farm and off. If there's damage to a solar farm's battery there's a risk toxic elements and noxious gases can wash into nearby waterways.
- Water from the proposed solar farm feeds into the Shoalhaven (on the West) and Brick Kiln Creek (on the East). Households use this water. Farm animals and wildlife drink from these streams. If polluted, next door and nearby farmers will lose vital water sources to an extent could threaten farm viability.

For
the right farm in the right place

- Remediation of such damage can be hugely expensive. Who would pay for any damage? The developer? The Council? The government? Nobody says they will.
- Not addressing these possibilities at the start has caused problems in other communities. We should ensure they don't happen here.

Building a solar farm in Braidwood's drinking water catchment area just doesn't make sense
