

Measuring Guide Policy

It is the policy of the Aurora Lake Association (ALA) to measure new vessels as part of the Lake Access Permit Application for Aurora Lake. This is meant to document that process:

Items required:

1. String weight
2. Tape, or Chalk
3. Tape Measurer

Motorized / non-mototrized vessel:

1. Vessel should be positioned on a trailer, and level ground. Measurements should be taken at 90 degree angles.
2. Drop a string weight from the tip of the boat. Place a mark on the ground and where the still string weight touches the ground.
3. Drop a string weight from the transom of the boat. Place a mark on the ground and where the still string weight touches the ground.
4. Measure the distance between the marks with measuring tape.

Pontoon vessel:

Duplicate the process above by measuring one of the toons and as opposed to the vessel.

Advisory: Homeowner should use this as a guide for purposes of buying a boat, and if the manufacturer specification and title prove the vessel is 20 feet, or 23 feet respectively. Be aware in these cases the ALA reserves the right to measure the vessel and if there are any questions. If the sequential steps in the Buying / Selling Policy are not met, then the vessel will not qualify for permit.
