Raw Data Sheet 6-11-2026

Notes

6-11-2026 - Aurora Lake

AQUA DOC conducted our 4th assessment visitation to Aurora Lake on 6-11-2026 to collect water quality information and determine if any algaecides applications were necessary for the lake. The lake generally appeared to have a lower quantity of Microcystis throughout its main body and the only notable amount of algae was located at the boat launch (pictured). The lake water had a tinge of color to it and a noted reduced Secchi transparency was observed at the time of sampling since our last visitation 2 weeks ago (1.75 ft vs. 3.25 ft).

Depth profile data continues to showcase expected trends for a shallow, polymictic lake system. Temperature and dissolved oxygen stayed relatively consistent up until the final 4.0 ft of depth where the early signs of a thermocline appeared to be forming. Dissolved oxygen showcased significant reduction within this depth with negative ORP values supporting reduction reactions (high likelihood of internal phosphorus release).

Spatial chlorophyll data showcased an average concentration of 3.97 mg/L. Specific data points from our 10 sampling locations are as follows (PLEASE NOTE THAT THE MAP IS EXPERIENCING ISSUES AT THE TIME OF THIS REPORT. THE LOCATIONS ARE THE SAME AS PREVIOUS SAMPLING EVENTS IN OTHER REPORTS):

AL1: 3.95 mg/L
AL2: 3.15
AL3: 4.39
AL4: 4.62
AL5: 3.73
AL6: 4.12
AL7: 3.05
AL8: 4.04
AL9: 7.33
AL10: 2.89

Within the Hawthorn channel, an example of common waterweed (*Elodea canadensis*) was noted in a few locations adding to potential macrophytes that could possibly grow in Aurora Lake should clarity improve overtime. During our observations of the lake, no lilies were noted besides the usual cow lilies (spatterdock) that normal grows in select areas.

We will make a return trip in approximately 2 weeks. No applications were conducted during today's visitation.
