RHEINBERRY

Rheinberry - experts in airport security solutions

Rheinberry provides

- Business and Strategic Planning
- Partnering and Brokering to foster and deliver innovation
- Programme Recovery and Turnaround
- Implementation and Delivery

Rheinberry specialises in optimising airport security systems, technology and processes leveraging ACI EUROPE's open architecture principles which one of our founders has been integral to. We firmly believe security is more than just a technical exercise and the passenger experience is key.

Our approach gives you clarity of information from multiple data sources and ease of integration. Providing you with a more cost effective and operationally efficient security operation.

We bring decades of experience working with some of the world's busiest airports.

While our focus is on airports, we're not blind to other markets, for example we provided a team to a UK-based reinsurance company to assist with programme delivery of a regulatory product.

Your airport or systems are likely to be siloed and your data will not be painting an accurate picture of your operation.

- What if you could access all the data you needed in a single place?
- What if you could connect multiple devices from a range of suppliers and leverage common interfaces, systems and data?
- How much of a saving would the reduced time for report preparation, system integration, testing and support save you?

Rheinberry is here to assist with all of this.

A selection of the organisations which Rheinberry worked with:

Aviation security is often seen as the gold standard, why not investigate with Rheinberry how its techniques and approaches can be applied to your industry and organisation?

RHEINBERRY

With Rheinberry you maintain control and define the objectives - we're not here to take over but always ready to assist

With our team of consultants we firmly believe we can deliver your projects and programmes more efficiently than our rivals. We make it our mission to work in an ethical manner that benefits you, our customer. We're not here to deliver a huge team of consultants and use your project as a way to train new graduates.

At its heart Rheinberry is the brainchild of two people, Richard and Joe. They met on a project at Heathrow Airport in 2015 and quickly established a rapport. Over the years both had worked with many consultants and they decided to link the really good ones, the cream of the crop and form Rheinberry.

Richard has worked in many industries since graduating but finds the airport environment particularly interesting. Yes, he's a pilot so being around aeroplanes always makes him smile, but beyond that it's the complexity and multi-disciplinary environment of the airport that continues to excite him.

Richard's biggest achievement has been co-writing ACI's 1st and 2nd versions of Open Architecture for Airport Security Systems. He's continued to be a thought leader on the subject and welcomes answering questions on this subject.

Rheinberry's Joe Yaeger has 30+ years consultancy experience across aerospace, finance, retail, automotive and aviation sectors. He authored the "Where Does Open Architecture Fit in Aviation Today?" blog for ACI
