## about minority organ donation

More than 100,000 people in the U.S. are waiting for an organ transplant, according to the Organ Procurement and Transplantation Network. Nearly 60% of people on transplant waiting lists come from minority communities.

Higher rates of heart disease, high blood pressure and diabetes are present in minority communities, contributing to more kidney failure. Almost 89,000 people are waiting for a kidney transplant.

Though organs are not matched based on race and ethnicity, certain criteria, including blood type and specific antibodies, must be matched to find a compatible organ. People from various ethnic groups will have a better outcome with a donor organ from someone of a similar background.

In general, wait times in the U.S. to receive a deceased donor kidney vary based on region, but can be anywhere from three years up to 10 years. Only about 30% of donor organs are from people of color, so diverse organs are less available.

Kidney donation is the most common type of living-donor transplant. Donors give one of their two healthy kidneys to the recipient. People only need one kidney to live a healthy, active life. In 2023, more than 6,900 lives were saved thanks to the generosity of living donors, according to Donate Life America.

how you can help.

### Some of the common things heard from patients include:

**MYTH:** People who donate organs or tissues can't have an open-casket funeral.

**FACT:** Donors' bodies are treated with care and respect. And they're dressed for burial. No one can see that they donated organs or tissues.

**MYTH:** I'm too old to donate. Nobody would want my organs.

**FACT:** There's no defined cutoff age for donating organs. The decision to use your organs is based on strict medical criteria, not age. Don't prematurely disqualify yourself. Let the doctors decide at the time of your death whether your organs and tissues are suitable for transplantation.

**MYTH:** My family will be charged if I donate my organs after death.

**FACT:** The organ donor's family never pays for their donation. The donor family pays for all the medical care once you are determined to be a possible donor. Sometimes, families think those costs are for organ donation. But the person who gets the organs for transplant pays the costs for removing the organs.

**MYTH:** As a living donor, I must be on medication for the rest of my life.

**FACT:** Living donors do not have any long-term medication requirements after donation.

**MYTH:** Becoming a living donor is a lengthy and costly process.

**FACT:** Anyone interested in becoming a living donor will have to undergo online screening and an in-depth physical and psychological evaluation process to ensure they are a good candidate for donation. The recipient's insurance always covers the cost. However, there are some programs available to compensate potential donors for time lost from work or school or to help with travel or dependent care expenses. Once a donor is approved, the timeframe is up to the donor, recipient and the respective care teams.

**MYTH:** Being a living donor will shorten my life span.

**FACT:** Most healthy people can live with only one kidney. We expect a person to live a full and normal life following their donation. At Mayo Clinic, we have living donors who have gone on to do incredible athletic feats, including climbing Kilimanjaro, running marathons and having children.
