

Future POS Payments: Powered by Shift4

Protect Your Business with the Industry's
Most Secure Payment Processing Solution

The Highest Level of Data Security

Our payment platform offers the highest level of transaction and financial data security, including certified compliance with the Payment Card Industry Data Security Standard (PCI DSS). We have powerful tools in place to ensure that our merchant's transaction processing systems do not store or process sensitive payment card data, providing the highest level of data security available.

Tokenization

Our tokenization solution replaces sensitive cardholder data with a random alphanumeric value, delivering the best solution for merchants who want to protect their sensitive data. Our parent company, Shift4 Payments, actually invented tokenization in 2005 and has processed billions of tokenized transactions since introducing this technology.

Point-to-Point Encryption (P2PE)

Our **PCI-validated P2PE** solution prevents cardholder data from entering your payment environment – protecting your customers from the harmful and costly effects of a data breach. Many companies claim Point-to-Point Encryption but few are PCI validated, which makes a big difference if you want ultimate security.

Lower Compliance Costs

Not only does our P2PE solution provide maximum security, but it drastically reduces the overhead and resources needed for PCI compliance. Businesses with P2PE do not require annual system scans and the Self-Assessment Questionnaire (SAQ) requirement is reduced from over 300 questions to only 33 questions!

Best-in-Class Payment Platform

Reliability

We have had 100% system uptime since 2008 with fully redundant, geographically diverse data centers powering our robust processing infrastructure.

Speed

Our systems boast the industry's fastest authorizations and settlements to help eliminate long lines and slow checkouts at your business.

Functionality

Our payment platform offers a complete enterprise solution, including credit, PIN debit, gift cards, signature capture, check verification, and EMV.
