User	App	Cloud backend

start using the app anonymously → **stores a session token and a random number as an anonymous user ID** → **store scores and content access timestamp against the anonymous user ID** → **knows the history of the anonymous user ID but cant associate it to a real person**

only available under core product

start using the app with a group code → **stores a session token and a random number as an anonymous user ID** → **store scores and content access timestamp against the anonymous user ID** → **knows the history of the anonymous user ID but cant associate it to a real person**

of the format xx-xxxxxx is available to all - core product, organization accounts, sub accounts

maintains the link of that user agasinst the group whose code was used to start the app → **uses the history of the user to present group reports. Reports can track status of a group but cannot associate the results to an individual real person**

can identify the group as a whole because when group was created (and the code generated) a name was used to identify the group (by admin)
