

HOW TO GET BEST RESULTS

SEEDS AND CUTTINGS

ROOTS

Activate seed germination and protect new cuttings. **Dip cuttings or sprinkle** lightly into the seed hole for immediate root support. 100% water soluble.

REPOTTING

ROOTS

Minimize transplant shock and accelerate root colonization. **Mix Microbe Shot directly into soil or coco.** 100% water soluble.

GROW

GROW PHASE

Maximize nutrient and water uptake throughout the vegetative phase. Mix one shot with 10L of water and **apply during weeks 2-3 for optimal root expansion.**

EARLY BLOOM PHASE

BLOOM

Increase flower mass, resin, and overall yield. Microbes boost the plant's metabolism during crucial phases. Mix one shot with 10L of water and **apply the first week of flowering**

LATE BLOOM PHASE

BLOOM

Maintain a healthy, living substrate for maximum results. Mix one shot with 10L of water and **apply in week 5 of flowering** (start of the final month).
