

### Panhard Bar Sizing Information

Please Fill in the form as accurately as possible, we prefer to work in mm, however if you would be more comfortable using Inches, please indicate this.

When measuring what lengths are required, its best to fit your joints and jam nuts (leave 2 threads showing, not fully bottomed out, so there's room for adjustment), then measure from jam nut to jam nut, ensure your vehicles body is centred on the chassis and it's not on axle stands.

- Total length of the bar not including joints or jam nuts.
- If you don't have any joints to mock the length up, please give us the total length between the two mounting holes, we can use our joints to determine the bar length for you.
- The type of joint you would like to use, for example (3/4" UNF Heim)
- Which directions you would like the threads to be, Either left or right hand, or both left and right on each bar.

If you would like misalignment spacers supplying, we need some further information.

- What is the internal mounting width of the mounting bracket, please check both ends as they could be different.
- What diameter Bolts are you planning to use, Commonly M14 or M16 are used.

If you have any more information we might find useful please add it here:
