

US009542870B2

(12) United States Patent

Auyeung et al.

(54) BILLBOARD AND LIGHTING ASSEMBLY WITH HEAT SINK AND THREE-PART LENS

(71) Applicant: **Ultravision Technologies, LLC**, Dallas, TX (US)

(72) Inventors: **David Siucheong Auyeung**, Carrollton, TX (US); **William Y. Hall**, Dallas, TX

(US); Simon Magarill, Mountain View, CA (US)

(73) Assignee: Ultravision Technologies, LLC, Dallas, TX (US)

(*) Notice: Subject to any disclaimer, the term of this patent is extended or adjusted under 35

U.S.C. 154(b) by 0 days.

This patent is subject to a terminal dis-

claimer.

(57) ABSTRACT

A lighting assembly includes a substantially planar substrate and a number of light emitting diodes (LEDs) arranged in rows on a first surface of the substrate. The rows extend along a longitudinal axis of the substrate. The lighting assembly also includes a number of optical elements, each including a three-part lens. Each optical element is proximate an associated LED such that each optical element overlies a single LED and each LED underlies a single optical element. A heat sink is thermally coupled to a second surface of the substrate that is opposite the first surface. The heat sink has a first section substantially parallel to the substrate and a number of fins extending away from the first section and substantially perpendicular thereto. A longitudinal axis of each fin is substantially perpendicular to the longitudinal axis of the substrate.

TECHNICAL FIELD

The following disclosure relates to lighting systems and, more particularly, to lighting systems using light emitting diodes to externally illuminate signs.

SUMMARY

The present invention, in one aspect thereof, comprises a back panel for use in a light emitting diode (LED) lighting assembly. An extruded substrate formed of a thermally conductive material is provided, the substrate having a 60 plurality of fins extending from a first side of the substrate, each of the fins having a substantially rectangular shape oriented so that a longitudinal axis of the fin is substantially parallel to a longitudinal axis of the substrate. At least some of the fins include a hole formed through the fin to enable 65 heated air to rise through the fins. A plurality of LEDs are mounted on a second side of the substrate, and oriented in

2

a longitudinal orientation with the fins oriented parallel to the bottom edge of a surface to be illuminated, such that heat rises perpendicular to the surface of the fin.

BRIEF DESCRIPTION OF THE DRAWINGS

For a more complete understanding, reference is now made to the following description taken in conjunction with the accompanying Drawings in which:

FIG. 1A illustrates one embodiment of a billboard that may be externally lighted by one or more lighting assemblies:

FIGS. 1B-1D illustrate embodiments of angular positions of the lighting assembly of FIG. 1 relative to the billboard; FIG. 2 illustrates one embodiment of a lighting assembly that may be used to light the billboard of FIG. 1;

FIGS. 3A and 3B illustrate one embodiment of a back panel that may be used in the lighting assembly of FIG. 2;

FIG. 3C illustrates one embodiment of the back panel of FIGS. 3A and 3B with a light panel and an optics panel that may also be used in the lighting assembly of FIG. 2;

FIGS. 4A and 4B illustrate one embodiment of a light panel that may be used with the lighting assembly of FIG. 2.

FIG. 5A, 5B, 5C and 5D illustrate one embodiment of an optics panel that may be used with the lighting assembly of FIG. 2;

FIGS. 6A-6C illustrate a more detailed embodiment of the lighting assembly of FIG. 2;

FIGS. 7A and 7B illustrate an embodiment of a back panel that may be used with the lighting assembly of FIGS. 6A-6C;

FIG. 8A illustrates an embodiment of an LED assembly and an optics panel that may be used with the lighting assembly of FIG. 6;

FIGS. **8**B-**8**J illustrates embodiments of the optics panel of FIG. **8**A and optical elements that may be used to form part of the optics panel; and

FIG. 9 illustrates a more detailed embodiment of the lighting assembly of FIG. 2.

DETAILED DESCRIPTION OF ILLUSTRATIVE EMBODIMENTS

Billboards, such as those commonly used for advertising in cities and along roads, often have a picture and/or text that must be externally illuminated to be visible in low-light conditions. As technology has advanced and introduced new lighting devices such as the light emitting diode (LED), such advances have been applied to billboards. However, current lighting designs have limitations and improvements are needed. Although billboards are used herein for purposes of example, it is understood that the present disclosure may be applied to lighting for any type of sign that is externally illuminated.

Referring to FIG. 1A, one embodiment of a billboard 100 is illustrated. The billboard 100 includes a surface 102 onto which a picture and/or text may be painted, mounted, or otherwise affixed. The surface 102 may be any size, such as a commonly used size having a width of forty-eight feet wide and a height of fourteen feet. The surface 102 may be provided by placing a backing material on a frame 104 made of steel and/or other materials. The frame 104 may be mounted on one or more support poles 106, which may be considered part of the frame 104 or separate from the frame

104. The billboard 100 may include a walkway or other support structure 108 that enables the surface 102 to be more easily accessed

One or more lighting assemblies 110 may be coupled to the walkway 108 (e.g., to a safety rail or to the walkway 5 itself) and/or to another structural member of the billboard 100 to illuminate some or all of the surface 102 in low light conditions. The lighting assembly 110 may be mounted at or near a top edge 112 of the billboard 100, a bottom edge 114 of the billboard 100, a right edge 116 of the billboard 100, 10 and/or a bottom edge 118 of the billboard 100. The lighting assembly 110 may be centered (e.g., located in approximately the center of the billboard 100) or off center as illustrated in FIG. 1A.

With additional reference to FIGS. 1B-1D, a surface 120 15 of the lighting assembly 110 may be parallel with respect to the surface 102 of the billboard 100 (FIG. 1B), may be perpendicular with respect to the surface 102 (FIG. 1C), or may be angled with respect to the surface 102 (FIG. 1D). It is understood that the lighting assembly 110 may be placed 20 in many different orientations and locations relative to the billboard 100 and to one another, and the illustrated positions are only for purposes of example. Furthermore, it is understood that references to "top," "bottom," "left," and "right" are used in the present disclosure for purposes of 25 description and do not necessarily denote a fixed position. For example, the billboard 100 may be turned on end, and the referenced "top," "bottom," "left," and "right" edges may still be readily identifiable although the "top" edge would be the "left" edge or the "right" edge.

One problem with current lighting technology is that it can be difficult to direct light only onto the surface 102 and even more difficult to do so evenly. This may be due partly to the placement of the lighting assembly 110, as shown in FIGS. 1B-1D. As the lighting assembly 110 is off center 35 relative to the surface 102, light emitted from the lighting assembly 110 may not evenly strike the surface 102. One problem with uneven illumination is that certain parts of the surface 102 may be more brightly illuminated than other parts. This creates "hot spots" that may be undesirable. 40 Attempting to evenly illuminate the surface 102 may cause light to be directed past the edges 112, 114, 116, and 118 as attempts are made to balance out hot spots in particular areas. However, light that does not strike the surface 102 is wasted and may create problems (e.g., light pollution), as 45 well as waste illumination that could be used for the surface

In addition to the difficulties of evenly illuminating the surface 102, the use of LEDs in an exterior lighting environment involves issues such as heat dissipation and protecting the LEDs against environmental conditions such as moisture. The presence of moving mechanical features such as fans that may be used to provide increased airflow for cooling may create additional reliability problems. Due to the difficulty and expense of replacing and/or repairing the 55 lighting assembly 110 in combination with the desire to provide consistent lighting while minimizing downtime, such issues should be addressed in a manner that enhances reliability and uptime.

Referring to FIG. 2, one embodiment of a lighting assembly 200 is illustrated. The lighting assembly 200 provides a more detailed embodiment of the lighting assembly 110 of FIG. 1. The lighting assembly 200 includes a back panel 202, a light panel 204 (e.g., a printed circuit board (PCB)) having a plurality of LEDs (not shown) mounted thereon, 65 and an optics panel 206. As will be described below in more detailed examples, light from the LEDs of the light panel

4

204 may be directed by the optics panel 206 to illuminate the surface 102 of the billboard 100 of FIG. 1. The back panel 202 may be configured to serve as a supporting substrate for the light panel 204 and optics panel 206, as well as to dissipate heat produced by the LEDs.

It is understood that any of the back panel 202, light panel 204, and optics panel 206 may actually be two or more physical substrates rather than a single panel as illustrated in FIG. 2. Furthermore, it is understood that there may be additional panels positioned behind the back panel 202, in front of the optics panel 206, and/or between the back panel 202 and light panel 204 and/or between the light panel 204 and optics panel 206.

Referring to FIGS. 3A-3C, one embodiment of the back panel 202 is illustrated with a front surface 302 and a back surface 304. The back panel 202 includes a top edge 306, a bottom edge 308, a right edge 310, and a left edge 312. The panel 202 may be formed of one or more thermally conductive materials (e.g., aluminum) and/or other materials.

The front surface 302 provides a mounting surface for the light panel 204. In some embodiments, the front surface 302 of the panel 202 may include one or more protrusions 314a and 314b that are substantially parallel to the top edge 306. The protrusions 314a and 314b may be configured to protect the light panel 204 from moisture. Although only two protrusions 314a and 314b are illustrated, it is understood that a single protrusion may be provided or three or more protrusions may be provided. Furthermore, such protrusions may vary in length, shape (e.g., may have angled or curved surfaces), orientation, and/or location on the front surface 302.

Referring specifically to FIG. 3C, a light panel 204 and an optical panel 206 may be mounted under the protrusion 314a (FIG. 3C). Moisture running down the front surface 302 in the direction of arrow 316 may strike the protrusion 314a and be directed away from the light panel 204 and optical panel 206 as shown by arrow 318. Although not shown, moisture may also be directed length down the protrusion 314a. Accordingly, protrusion 314a may serve as a gutter and aid in directing moisture away from a joint 320 where the optical panel 206 abuts the front surface 302. This may be beneficial even when a moisture resistant compound is used to seal the joint 320. In embodiments where there are multiple light panels 204 arranged vertically on the front surface 302, there may be a protrusion positioned above each light panel 204. For example, the protrusion 314a may be positioned directly above one light panel 204 and the protrusion 314b may be positioned directly above another light panel 204.

Referring specifically to FIG. 3B, the back surface 304 may be configured to increase heat dissipation. For example, the back surface 304 may be configured with a heat sink provided by fins 322a-322N, where N denotes a total number of fins. The fins 322a-322N increase the surface area of the back surface 304, thereby providing for additional heat dissipation to the surrounding air. The fins 322a-322N may be formed as part of the panel 202 or may be otherwise coupled to the panel 202 (e.g., may be part of a discrete heat sink that is coupled to the back surface 304). Some or all of the fins 322a-322N may be angled, as shown by fins 322a and 322b. In some embodiments, holes (not shown) may be provided in some or all of the fins 322a-322N to aid in air circulation. In such embodiments, the holes may cause a chimney effect in which heated air rises through the holes and is replaced by cooler air. This may be particularly effective in environments where natural air movement is limited.

Referring to FIGS. 4A and 4B, one embodiment of a single PCB 402 of the light panel 204 is illustrated. In the present example, the light panel 204 may include multiple PCBs 402, although it is understood that any number of PCBs may be used based on design issues such as the 5 amount of illumination needed, the amount of illumination provided by a single PCB 402, the size of the surface 102 of the billboard 100, and/or other factors. As shown in the present embodiment with a substantially rectangular cross-section, the PCB 402 includes a front surface 404, a back 10 surface 406, a top edge 408, a bottom edge 410, a right edge 412, and a left edge 414.

5

The PCB **402** may include one or more strings of LEDs **416**, with multiple LEDs **416** in a string. For example, a string may include eight LEDs **416** and each PCB **402** may 15 include two strings for a total of sixteen LEDs **416**. In this configuration, a light panel **204** having eight PCBs **402** would include ninety-six LEDs **416**. It is understood that although the PCBs **402** are shown as being substantially identical, they may be different in terms of size, shape, and 20 other factors for a single light panel **204**.

In the present example, the LEDs **416** are surface mounted, but it is understood that the LEDs **416** may be coupled to the panel **204** using through hole or another coupling process. The surface mounted configuration may 25 ensure that a maximum surface area of each LED **416** is in contact with the PCB **402**, which is in turn in contact with the back panel **202** responsible for heat dissipation. Each string of LEDs may receive a constant current with the current divided evenly among the LEDs **416**.

Referring to FIGS. 5A, 5B, 5C and 5D, one embodiment of a single lens panel 500 of the optics panel 206 is illustrated. In the present example, the optics panel 206 may include multiple lens panels 500, although it is understood that any number of lens panels may be used based on design 35 issues such as the number, arrangement, and orientation of the LEDs 416, the size of the surface 102, and/or other factors. As shown in the present embodiment with a substantially rectangular cross-section that is configured for use with the PCB 402 of FIG. 4, a single lens panel 500 includes 40 a front surface 502, a back surface 504, a top side 506, a bottom side 508, a right side 510, and a left side 512. The sides 506, 508, 510, and 512 may form a cavity into which the PCB 402 may fit, thereby providing protection for the PCB 402 from environmental conditions such as moisture. 45

The lens panel 500 may include a beveled or angled top side 506 and/or bottom side 508 as illustrated in FIG. 5B. The beveling/angling may aid in preventing moisture from reaching the PCB 402 under the lens panel 500, as water will more readily flow from the area of the joint 320 (FIG. 3C) 50 due to the angled surface than if the top side 506 was relatively flat.

The lens panel **500** may include multiple optical elements **514**. A single optical element **514** may be provided for each LED **416**, a single optical element **514** may be provided for 55 multiple LEDs **416**, and/or multiple optical elements **514** may be provided for a single LED **416**. In some embodiments, the optical elements **514** may be provided by a single multi-layer optical element system provided by the lens panel **500**.

In the present example, the optical elements **514** are configured so that the light emitted from each LED **416** is projected onto the entire surface **102** of the billboard **100**. In other words, if all other LEDs **416** were switched off except for a single LED **416**, the entire surface **102** would be 65 illuminated at the level of illumination provided by the single LED **416**. In one embodiment, the rectangular target

6

area of the surface 102 would be evenly illuminated by the LED 416, while areas beyond the edges 112, 114, 116, and 118 would receive no illumination at all or at least a minimal amount of illumination from the LED 416. What is meant by "evenly" is that the illumination with a uniformity that achieves a 3:1 ratio of the average illumination to the minimum. Thus, by designing the lens in such a manner, when all LEDs are operating, the light form the collective thereof will illuminate the surface at the 3:1 ratio. When one or more LEDs fail, the overall illumination decreases, but the uniformity maintains the same uniformity. Also, as described hereinabove, the "surface" refers to the surface that is associated with a particular LED panel. It may be that an overall illuminated surface is segmented and multiple panels are provided, each associated with a particular segment

FIG. 5C illustrates a detail of the lens assembly. Each of the diodes 416 is mounted on the board 408 at a minimum distance. Overlying the board and LEDs 416 is transparent lens substrate **520**. This substrate **520** has a plurality of lens structures 522, each associated with one of the LEDs 416, such that each of the LEDs 416 has the light emitted therefrom directed outward towards the surface, each lens structure being substantially the same. The minimum distance is designed such that overlapping light from adjacent LEDs does not create interference patterns and result in dead spots on the surface. The lens structure 522 is designed to create the 3:1 uniformity and also, the lens structure is designed to "direct" the light from an edge of the surface to cover the entire surface. This is shown by the angle of the light rays in FIG. 5C. Also, the beveled edge 530 will basically surround the PCB 402, thus protecting it from moisture. The lens substrate 520 is secured with screws (not

FIG. 5D illustrates a detail of the lens structure 522. This structure includes an interior surface 524 and an exterior surface 526 that shapes and directs the light in the correct pattern. This is an acrylic material. With such a design, the lighting assembly can be disposed at an edge of the surface to illuminate the entire surface.

In some embodiments, as shown in FIG. 1, two lighting assemblies 110 may be used. Each lighting assembly may be powered by a separate power supply (not shown), and may be configured to illuminate the entire surface 102. In such an embodiment, if one power supply fails, the remaining lighting assembly 110 will still illuminate the entire surface 102, although at a lesser intensity than when both lighting assemblies 110 are functioning. This provides evenly distributed illumination when both lighting assemblies 110 are functioning correctly, and continues to provide evenly distributed illumination when one lighting assembly 110 malfunctions. Accordingly, the entire surface 102 of the billboard 100 may be illuminated even when an entire lighting assembly 110 has malfunctioned and is providing no illumination at all due to the redundancy provided by configuration of the lighting assemblies 110.

Furthermore, in some embodiments as described above, each LED 416 of a single lighting assembly 110 may be configured via the optical elements 514 to illuminate the entire surface 102. In such embodiments, if one or more LEDs 416 or strings of LEDs fails, the remaining LEDs 416 will still illuminate the entire surface 102, although at a lesser intensity than when the failed LEDs 416 are functioning. This provides evenly distributed illumination when all LEDs 416 are functioning correctly, and continues to provide evenly distributed illumination when one or more LEDs are malfunctioning. Accordingly, the billboard 100

may be illuminated even when multiple LEDs 416 have malfunctioned and are providing no illumination at all due to the redundancy provided by configuration of the lighting assemblies 110.

It is understood that some embodiments may direct sub- 5 stantially all illumination from a lighting assembly 110 evenly across the surface 102 while some illumination is not evenly distributed. For example, substantially all LEDs 416 may be directed to each evenly illuminate the surface 102 with the exception of a relatively small number of LEDs **416**. In such cases, the illumination provided by the remaining LED or LEDs 416 may be directed to one or more portions of the surface 102. If done properly, this may be accomplished while minimizing any noticeable unevenness in the overall illumination, even if one of the remaining LEDs 416 malfunctions. For example, the lighting assembly 110 may be configured to direct the illumination provided by one LED 416 to only the left half of the surface 102, while directing the illumination from another LED 416 to only the right half of the surface 102. The loss of one of these two 20 LEDs may not noticeably impact the illumination of the surface 102. It is understood that such variations are within the scope of this disclosure.

In embodiments where the illumination is evenly distributed across the surface 102, it is understood that the optics 25 panel 206 may be configured specifically for the light panel 204 and the surface 102. For example, assuming the surface 102 is forty-eight feet wide and sixteen feet high, the lens panel 500 of FIG. 5 may be specifically designed for use with the PCB 402 of FIG. 4. This design may be based on 30 the particular layout of the PCB 402 (e.g., the number and arrangement of the LEDs 416), the amount of illumination provided by the LEDs 416, the size of the surface 102, the distance between the lens panel 500 and the surface 102, the angle at which the lens panel 500 is mounted relative to the 35 surface 102 (e.g., FIGS. 1B-1D), and/or other factors. Accordingly, changes in any of these factors may entail a change in the design of the lens panel 500 in order to again evenly distribute the illumination provided by each LED 416 across the entire surface 102. It is understood that various 40 standard configurations of the lighting assembly 110 may be developed for various billboard and/or other externally illuminated signs so that a particular configuration may be provided based on the parameters associated with a particular billboard and/or externally illuminated sign.

Referring to FIGS. 6A-6C, one embodiment of a lighting assembly 600 is illustrated that provides a more detailed embodiment of the lighting assembly 200 of FIG. 2. The lighting assembly 600 includes a back panel 602, a light panel formed by multiple LED assemblies (denoted by 50 reference number 800 in FIG. 8A), and an optics panel formed by multiple lens panels 604. Accordingly, as described previously, the light panel 204 in the current example is represented by multiple LED assemblies 800 and the optics panel 206 is represented by multiple lens panels 55 604. In the present embodiment, the lighting assembly 600 includes four LED assemblies 800 and four lens panels 604.

Although various attachment mechanisms (e.g., threaded screws, bolts, and/or other fasteners) may be used to coupled the lens panels and LED assemblies to the back panel 602, 60 the present embodiment uses multiple threaded fasteners 605 (e.g., screws) that extend through the lens panels and the LED assemblies and engage threaded holes in the back panel 602.

The lighting assembly 600 is also illustrated with a 65 mounting plate 606 that couples to the back panel 602 and to an adjustable mounting bracket 608. The adjustable

8

mounting bracket 608 may be used to couple the lighting assembly 600 to a portion of the billboard 100 (FIG. 1) and/or to another support member. A power supply enclosure 610 may be coupled to the mounting plate 606 and configured contain a power supply (not shown) capable of supplying power to LEDs of the LED assemblies 800. It is noted that separating the power supply from the back panel 602 may aid in heat dissipation by the back panel 602 as it does not have to dissipate heat from the power supply to the same extent as if the power supply was mounted directly to the back panel 602.

The location of the power supply may also be beneficial as snow not melted by the heat produced by the LED may be melted by heat produced by the power supply. This may aid in reducing snow buildup on the LEDs.

With additional reference to FIGS. 7A and 7B, one embodiment of the back panel of FIG. 602 is illustrated. A front surface 700 includes multiple protrusions 702 that may be configured to protect the light panels (not shown) against moisture as previously described. The front surface 700 may include additional protrusions 704.

A back surface 706 includes multiple fins 708 that form a heat sink to aid in the dissipation of heat from the back panel 602. In the present example, the fins 708 are substantially rectangular in shape. In the present example, the back panel 602 is extruded and the fins 708 run parallel to the top edge with a longitudinal axis of each fin 708 being substantially parallel to a longitudinal axis of the back panel 602. Forming the fins 708 in a vertical manner is possible, but may increase the cost of the back panel 602 due to the extrusion process. As shown, the fins 708 may be substantially perpendicular to the back surface 706, and/or may be angled. In the present example, the fins 708 are angled such that near the top of the back panel 702, the fins 708 are angled towards the top.

Because the fins 708 are parallel to the top edge, heat may be trapped due to its inability to rise vertically. Accordingly, holes 710 may be present in some or all of the fins 708 (marked but not actually visible in the side view of FIG. 7B) to provide paths for the heat to rise vertically in spite of the orientation of the fins 708. The holes 710 may create a chimney effect that increases air flow across the fins 708 and aids in the cooling process. In some embodiments, some or all of the fins 708 may be angled such that heat is not trapped.

The back surface 706 may also include a groove 712 that is configured to receive a tongue of the mounting plate 606 in a tongue-in-groove manner.

With additional reference to FIGS. 8A-8J, embodiments of a single LED assembly 800 and a single lens panel 604 that may be used with the lighting assembly 600 are illustrated. As shown, the single LED assembly 800 and the single optics panel 604 may be configured for use together.

Referring specifically to FIG. 8A, the LED assembly 800 includes a substrate 802 (e.g., a PCB) onto which are mounted multiple LEDs 804. In the present example, the LED assembly 800 includes two strings of eight LEDs 804 each for a total of sixteen LEDs 804. It is understood that this is merely an example, and there may be more or fewer LEDs 804 on the light panel 800, and the LEDs 804 may be arranged in many different ways on the substrate 802.

Referring also to FIGS. 8B-8J, the optics panel 604 may include optical elements 806 arranged on an upper surface 808 of the optics panel 604. The optics panel 604 may further include sides 810, 812, 814, and 816 that are configured to fit around the edge of the substrate 802 of the light panel 800. The bottom edge of each side 810, 812, 814, and

816 abuts the front surface 700 of the back panel 602 and may be sealed to the front surface 700 using a moisture resistant sealant.

As shown in FIGS. 8D-8H, a single optical element 806 may include multiple lens elements designed to distribute the illumination provided by a single LED 804 across a surface such as the surface 102 of FIG. 1. A first lens element 820 may be positioned proximate to the LED 804, and additional lens elements 822, 824, and 826 may be positioned above the lens element 820. Multiple optical elements 806 may be combined and formed as a single optics panel 604 that is configured to operate with the LED assembly 800

Referring to FIG. 9, another embodiment of a lighting assembly 900 is illustrated that provides a more detailed embodiment of the lighting assembly 200 of FIG. 2. The lighting assembly 900 is similar to the lighting assembly 600 of FIG. 6, but includes six LED assemblies rather than the four six LED assemblies of the lighting assembly 600. It is understood that the lighting assembly 900 may require a larger power supply than the lighting assembly 600 (e.g., a one hundred and fifty watt power supply instead of a one hundred and twenty watt power supply).

Although the preferred embodiment has been described in detail, it should be understood that various changes, substitutions and alterations can be made therein without departing from the spirit and scope of the invention as defined by the appended claims.

What is claimed is:

- 1. An apparatus comprising a lighting assembly for illumination of an area, the lighting assembly comprising:
 - a substantially planar substrate;
 - a plurality of light emitting diodes (LEDs) arranged in a 35 plurality of rows on a first surface of the substrate, the rows extending along a longitudinal axis in a plane of the first surface of the substrate;
 - a plurality of optical elements, wherein each optical element of the plurality of optical elements is proxi- 40 mate an associated LED of the plurality of LEDs such that each optical element overlies a single LED and each LED underlies a single optical element, each optical element comprising a first part, a second part and a third part, wherein the first part comprises a first 45 curved surface, wherein the second part comprises a second curved surface that intersects with the first curved surface at a region between the first part and the second part, wherein the first part and the second part each have a peak relative to the substrate, the peak 50 being spaced from the region between the first part and the second part, and wherein the third part extends beyond the region between the first part and the second part in a direction away from the associated LED; and
 - a heat sink thermally coupled to a second surface of the substrate, the second surface opposite the first surface, the heat sink comprising a first section substantially parallel to the substrate so that each and every LED is separated from the heat sink by the substrate, the heat sink further comprising a plurality of fins extending away from the first section and substantially perpendicular thereto, each fin extending along an axis in the plane of the first surface of the substrate, the axis for each fin being substantially perpendicular to the longitudinal axis of the first surface of the substrate.
- 2. The apparatus of claim 1, wherein substantially planar substrate comprises a single substrate.

10

- 3. The apparatus of claim 1, wherein each optical element of the plurality of optical elements is separate from other optical elements of the plurality of optical elements.
- **4**. The apparatus of claim **1**, wherein the heat sink comprises a discrete heat sink.
- 5. The apparatus of claim 1, wherein the heat sink comprises an aluminum heat sink.
- 6. The apparatus of claim 1, wherein the fins are substantially flat.
- 7. The apparatus of claim 1, wherein the LEDs are arranged in only two rows.
- **8**. The apparatus of claim **1**, further comprising a power supply that is separated from the substrate.
- **9**. The apparatus of claim **1**, further comprising a billboard comprising the area, wherein the lighting assembly is located adjacent the billboard to illuminate the area, the fins extending in a direction away from the billboard.
- 10. The apparatus of claim 1, further comprising a bill-board comprising the area, wherein the lighting assembly is located adjacent the billboard to illuminate all of the area when a subset of the LEDs is not generating any light.
- 11. The apparatus of claim 1, further comprising a bill-board comprising the area, wherein the optical elements are configured so that failure of one or more LEDs of the lighting assembly will cause an illumination level of light impinging the area to decrease while a uniformity of the light impinging the area remains substantially the same as compared to when all LEDs are operational.
- 12. An apparatus comprising a lighting assembly for 30 illumination of an area, the lighting assembly comprising: a substantially planar substrate;
 - a plurality of light emitting diodes (LEDs) arranged in a plurality of rows on a first surface of the substrate, wherein the LEDs are arranged in only two rows, the rows extending along a longitudinal axis in a plane of the first surface of the substrate;
 - a plurality of optical elements attached to the substrate by threaded fasteners, wherein each optical element of the plurality of optical elements is separate from other optical elements of the plurality of optical elements, and wherein each optical element of the plurality of optical elements is proximate an associated LED of the plurality of LEDs such that each optical element overlies a single LED and each LED underlies a single optical element, wherein each optical element includes a first part, a second part and a third part, wherein the first part comprises a first curved surface, wherein the second part comprises a second curved surface that intersects with the first curved surface at a region between the first part and the second part, wherein the first part and the second part each have a peak relative to the substrate, the peak being spaced from the region between the first part and the second part, and wherein the third part extends beyond the region between the first part and the second part in a direction away from the associated LED;
 - a heat sink thermally coupled to a second surface of the substrate, the second surface opposite the first surface, the heat sink comprising a first section substantially parallel to the substrate so that each and every LED is separated from the heat sink by the substrate, the heat sink further comprising a plurality of fins extending away from the first section and substantially perpendicular thereto, each fin extending along an axis in the plane of the first surface of the substrate, the axis for each fin being substantially perpendicular to the longitudinal axis of the first surface of the substrate, and

wherein the first section of the heat sink includes a portion that extends past the substrate in a direction away from the fins; and

- a power supply that is separated from the substrate.
- 13. A billboard comprising:
- a support structure;
- a display surface mounted on the support structure; and
- a lighting assembly located so as to be able to illuminate a portion of the display surface during operation, wherein the lighting assembly comprises:
 - a substantially planar substrate;
 - a plurality of light emitting diodes (LEDs) arranged in a plurality of rows on a first surface of the substrate;
 - a plurality of optical elements, wherein each optical 15 element of the plurality of optical elements is proximate an associated LED of the plurality of LEDs such that each optical element overlies a single LED and each LED underlies a single optical element, wherein each optical element includes a first part, a 20 second part and a third part, wherein the first part comprises a first curved surface, wherein the second part comprises a second curved surface that intersects with the first curved surface at a region between the first part and the second part, wherein the first 25 part and the second part each have a peak relative to the substrate, the peak being spaced from the region between the first part and the second part, and wherein the third part extends beyond the region between the first part and the second part in a direction away from the associated LED; and
 - a heat sink thermally coupled to a second surface of the substrate, the second surface opposite the first surface, the heat sink comprising a first section substantially parallel to the substrate so that each and every LED of the plurality of LEDs is separated from the heat sink by the substrate, the heat sink further comprising a plurality of fins extending away from the first section and substantially perpendicular thereto, wherein the first section of the heat sink includes a portion that extends past the substrate in a direction away from the fins.
- 14. The billboard of claim 13, wherein the rows of LEDs extend along a longitudinal axis in a plane of the first surface 45 of the substrate, and wherein each fin extends along an axis in the plane of the first surface of the substrate, the axis for each fin being substantially perpendicular to the longitudinal axis of the first surface of the substrate.
- 15. The billboard of claim 13, wherein the optical elements are configured so that failure of one or more LEDs of the lighting assembly will cause an illumination level of light impinging the portion of the display surface to decrease while uniformity of the light impinging the portion of the display surface remains substantially the same as compared 55 to when all LEDs are operational.
- 16. The billboard of claim 13, wherein the lighting assembly further comprises a second planar substrate with LEDs arranged thereon, the second substrate arranged in a common orientation with the substrate so that all of the 60 LEDs of the substrate and the second substrate are arranged in a common orientation, wherein all of the substrate and the second substrate are mounted in a single assembly.
- 17. The billboard of claim 16, wherein the heat sink extends across both the substrate and the second substrate. 65
- 18. The billboard of claim 13, further comprising a second lighting assembly located adjacent the lighting assembly and

12

located so as to be able to illuminate a second portion of the display surface during operation, wherein the second lighting assembly comprises:

- a second substantially planar substrate;
- a second plurality of light emitting diodes (LEDs) arranged in a plurality of rows on a first surface of the second substrate, wherein the rows of the second plurality of LEDs extend along a longitudinal axis in a plane of the first surface of the second substrate;
- a second plurality of optical elements, wherein each optical element of the second plurality of optical elements is proximate an associated LED of the second plurality of LEDs such that each optical element of the second plurality overlies a single LED and each LED of the second plurality underlies a single optical element;
- a second heat sink thermally coupled to a second surface of the second substrate, the second surface opposite the first surface, the second heat sink comprising a first section substantially parallel to the second substrate so that each and every LED of the second plurality of LEDs is separated from the second heat sink by the second substrate, the second heat sink further comprising a second plurality of fins extending away from the first section of the second heat sink and substantially perpendicular thereto, wherein the first section of the second heat sink includes a portion that extends past the second substrate in a direction away from the second plurality of fins, wherein each fin extends along an axis in the plane of the first surface of the second substrate, the axis for each fin being substantially perpendicular to the longitudinal axis of the first surface of the second
- 19. The billboard of claim 18, wherein the display surface has visual media content displayed thereon, the visual media content comprising a picture and/or text;
 - wherein the display surface has a width of forty-eight feet along each of an upper edge and a lower edge of the display surface and a height of fourteen feet along each of a left side edge and a right side edge of the display surface:
 - wherein the portion of the display surface extends from the lower edge to the upper edge adjacent the left side edge and the second portion extends from the lower edge to the upper edge adjacent the right side edge, the portion and the second portion together extending from the left side edge to the right side edge;
 - wherein the lighting assembly is configured to illuminate the portion of the display surface; and
 - wherein the second lighting assembly is configured to illuminate the second portion of the display surface.
- 20. The billboard of claim 19, wherein the display surface can be illuminated using only the lighting assembly and the second lighting assembly so that the visual media content can be viewed without additional light.
- 21. A method of illuminating visual media content on a billboard display surface using a lighting assembly that comprises a power supply and a lighting unit that includes a substrate, a plurality of light emitting diodes (LEDs) arranged on the substrate, a plurality of optical elements, and a heat sink, the method comprising:
 - directing light from the LEDs toward a portion of the billboard display surface such that the light from the lighting unit illuminates the visual media content on the portion of the billboard display surface with an illumination level and a uniformity; and

directing heat generated by the LEDs away from the optical elements using the heat sink;

wherein the plurality of LEDs are arranged in a plurality of rows on a first surface of the substrate, the rows extending along a longitudinal axis in a plane of the first surface of the substrate;

wherein each optical element of the plurality of optical elements is proximate an associated LED of the plurality of LEDs such that each optical element overlies a single LED and each LED underlies a single optical element;

wherein each optical element of the plurality of optical elements is separate from other optical elements of the plurality of optical elements;

wherein each optical element includes a first part, a second part and a third part;

wherein the first part comprises a first curved surface; wherein the second part comprises a second curved surface that intersects with the first curved surface at a region between the first part and the second part, wherein the first part and the second part each have a peak relative to the substrate, the peak being spaced from the region between the first part and the second part:

wherein the third part extends beyond the region between the first part and the second part in a direction away from the associated LED;

wherein the heat sink is thermally coupled to a second surface of the substrate, the second surface opposite the first surface;

wherein each and every LED of the plurality of LEDs is separated from the heat sink by the substrate;

wherein the heat sink comprises a first section substantially parallel to the substrate and a plurality of fins extending away from the first section and substantially perpendicular thereto; and 14

wherein each fin extends along an axis in the plane of the first surface of the substrate, the axis for each fin being substantially perpendicular to the longitudinal axis of the first surface of the substrate.

22. The method of claim 21, wherein directing light from the LEDs comprises providing power to the LEDs from the power supply, wherein the power supply is separated from the substrate so that the heat sink does not dissipate heat from the power supply to the same extent as if the power supply was mounted directly to the substrate.

23. The method of claim 21, further comprising directing light from a second lighting unit toward the portion of the billboard display surface at the same time as directing light from the LEDs toward the portion of the billboard display surface.

24. The method of claim 21, further comprising directing light from a second lighting unit toward a second portion of the billboard display surface at the same time as directing light from the LEDs toward the portion of the billboard display surface, wherein the visual media content can be viewed using only the light directed from the lighting unit and the second lighting unit.

25. The method of claim 21, wherein directing light from the LEDs comprises illuminating the visual media content on the portion of the billboard display surface with the illumination level and the uniformity, wherein the optical elements are configured so that failure of one or more LEDs of the lighting unit will cause the illumination level of the light impinging the portion of the billboard display surface to decrease while the uniformity of the light impinging the portion of the billboard display surface remains substantially the same.
