▶ Saif Double Glazing

Saif Double Glazing takes a 360-degree approach to helping you achieve your goals, with our warm edge spacer products for Insulated Glass

▶ Saif Double Glazing

HEAT TRANSFER REDUCTION:

Global warming is, quite literally, a hot topic. The summers are getting hotter and longer. Heat waves are happening all over the globe and each year it is becoming unbearable causing hazards to our health.

If your home/office has air conditioning, Saif Double Glazed window units can assist in keeping the air in your home/office cooler and minimise heat transfer from the outdoor entering via conduction.

Fun Fact:

- ▶ "80% of energy loss through a window occurs at the edge because of the highly conductive nature of aluminium spacer."

NOISE REDUCTION:

With Saif Double Glazing noise is reduced up to 2 decibels creating a heaven of calm and peacefulness"

Saif Double Glazed Glass minimizes noise transfer, even if you live/work close to a busy road or have noisy workplace your home/office will still be a relative oasis of calm.

Spacer used in Saif Double Glazed Glass absorbs more noise which is normally transferred from outer pane to the inner pane of your windows.

Saif Double Glaze Glass can be installed equally in PVC-U or timber frames. The same benefits apply to all framing materials, even composites or steel.

▶ Saif Double Glazing

Less Heat loss means lower fuels bills for you. Less energy consumed results in lower carbon emission. This is good news for the environment.

LESS CONDUCTIVE:

Saif Double Glazed is less conductive than aluminium and, as most of the heat loss through a window occurs at the edge of the unit, standard metal spacer bars act as a thermal energy drain allowing heat to escape from your home.

Saif Double Glaze blocks this escape route.
