

GRASS LAWN INSTALLATION AFTERCARE

- In order for grass seed to germinate, it is essential to keep the seed moist and not let it dry out. This means misting the seed thoroughly with water, but not allowing it to drown in a puddle of water, at least once daily. During dry spells or extreme heat, you may have to mist more than once a day.
- Once germination occurs, decrease watering to 3-4 times per week. If the weather is exceptionally hot, you may need to water more frequently.
- You may begin to mow your lawn once it has reached a height of approximately 5"- 6". Adjust your lawnmower's blade height so that it will cut 1/3 of the height of the grass (leaving your grass at a height of approximately 3"- 4" when mowing is complete). After mowing your new lawn twice, future mowing may be completed at the height that is most fit for your variety of grass.
- **Disclaimer:** There is no guarantee or warranty on lawn installations. Routine upkeep is necessary for sustaining grass and preventing weeds; ask about our maintenance services.
