

IMPORTANT INFORMATION ABOUT LEAD IN YOUR DRINKING WATER

Tri-County Conservancy District, (TCCD), tests for levels of lead in its water supply as required by the compliance section of Indiana Department of Environmental Management (IDEM). Because TCCD found two elevated lead test samples during the 2018 test period, we were required to collect twenty (20) additional samples from participants in our service area between January 1 and June 30, 2019. All twenty (20) participant's test results were well under the compliance action level of 15 parts per billion, ranging from less than 0.5 to 1.2 parts per billion. Please understand that lead can cause serious health problems, especially for pregnant women and young children. Please read this information closely to see what you can do to reduce lead in your drinking water.

Health effects of lead

Lead can cause serious health problems if too much enters your body from drinking water or other sources. It can cause damage to the brain and kidneys and can interfere with the production of red blood cells that carry oxygen to all parts of your body. The greatest risk of lead exposure is to infants, young children, and pregnant women. Scientist have linked the effects of lead on the brain with lowered IQ in children. Adults with kidney problems and high blood pressure can be released later in life. During pregnancy, the child receives lead from the mother's bones, which may affect the child's brain development.

Sources of lead

Although rarely the sole cause of lead poisoning, lead in drinking water can significantly increase a person's total lead exposure, particularly the exposure of infants who drink baby formula and concentrated juices that are mixed with water. The EPA estimates that drinking water can make up 20 percent or more of a person's total exposure to lead.

Lead is unusual among drinking water contaminants in that it seldom occurs naturally in water supplies like river and lakes. Lead enters drinking water primarily as a result of the corrosion, or wearing away, of materials containing lead in the water distribution system and household plumbing. These materials include lead-based solder used to join copper pipe, brass and chrome plated brass faucets, and in some cases pipes made of lead that connect houses and buildings to water mains (service lines). In 1986, Congress banned the use of lead solder containing greater than 0.2 percent lead and restricted the lead content of faucets, pipe and other plumbing material to 8.0 percent.

When water stands in lead pipes or plumbing systems containing lead for several hours or more, the lead may dissolve into the drinking water. This means the first water drawn from the tap in the morning, or later in the afternoon if the water has not been used all day, can contain fairly high levels of lead.

Steps you can take in the home (or anywhere else) to reduce exposure to Lead in drinking water

Let the water run from the tap before using it for drinking or cooking any time the water in the faucet has gone unused for more than six (6) hours. The longer the water resides in the plumbing, the more lead it may contain. Flushing the tap means running cold water faucet until water gets noticeably

colder, usually about 15-30 seconds. Although toilet flushing or showering flushes water through a portion of your homes plumbing system, you still need to flush the water in each faucet before using it for drinking water. To conserve water, fill a couple of bottles for drinking water after flushing the tap, and whenever possible use the flush water to wash dishes or water plants.

Try not to cook with or drink water from the hot water tap. Hot water can dissolve lead more quickly than cold water. If you need hot water, draw it from the cold tap and then heat it. Boil water for drinking and cooking.

The steps described above will reduce the lead concentration in you drinking water. However, if you are still concerned, you may wish to purchase bottled water for drinking and cooking.

For more information, call us at 317-856-0224 or visit our website www.tricountyconservancy-in.gov. For more information on reducing lead exposure around your home or building and the health effects of lead, visit EPA's Web site at www.epa.gov/lead or contact your health care provider who can perform a blood test for lead and provide you with information about its health effects. State and local government agencies that can be contacted include:

- Tess Cutshaw, District Manager at 317.856.0224 can provide you with information about TCCD's water supply.
- Indiana State Department of Health at 317.233.1250 or the Morgan County Health Department 765.342.6621 can provide you with information about the health effects of lead.

Customers can get their water tested for lead by contacting a laboratory certified to test for lead in drinking water. A list of those laboratories is available online at <https://www.in.gov/isdh/22452.htm>

We are communicating this public education notice to inform and educate our customers on the effects of lead and ways to reduce lead in your drinking water. Tri-County Conservancy District will be sampling another twenty samples between July 1 and December 31, 2019. If you do not have a water softener and would be interested in participating in our lead copper sampling program, please contact Tri-County Conservancy District at 317-856-0224.
