

PBM Light

Therapeutic Red Light Therapy Device

Relieve pain. Promote healing.

What is PBM Light Therapy?

PBM stands for *PhotoBioModulation*, which means light (photo) life (bio) and change (modulation). In the 1960s, light therapy was recognized as a treatment modality known as low level laser therapy (LLLT). Oral IQ's PBM Light units provide the same therapeutic benefits as LLLT; restores tissues, relieves pain and reduces inflammation.

When can PBM Light be used?

PBM Light provides immediate relief to a wide range of joint, muscle and nerve pain. From TMJ and carpal tunnel syndrome to pre-conditioning and rapid recovery from sports injuries (sprained ankles, friction burns) to dental surgical site healing. PBM Light is also effective managing side effects of chemotherapy such as oral mucositis.

When can PBM Light be used?

Absolutely! PBM Light is safe and effective without any side effects. It has been FDA approved as a Class 2 light therapy device and a K-100213 category medical device.

HOW DOES IT WORK?

PBM Light works at the cellular level stimulating mitochondria in your body's cells. This increases ATP production (energy units). When cells are energized they can perform their functions optimally.

PBM Mechanism at the cellular level

ATP
unit of energy

Mitochondria: The Powerhouse
receives light energy & increases ATP production.

ORAL IQ™
