**Manage** production and customer orders in one system. Buy parts with MRP or Re-Order point logic. Connect purchase receipts to AP invoices. Build items with detailed BOM's and Labor Instructions. Create quotes to customers. Track open orders, back orders, and invoices. Open screens for inventory and customers at the same time. Right-click to quickly reference historical information for purchases or general ledger activity. All these activities pass data to the GL system from the AP, AR and Payroll automatically via Journal Vouchers.

**Organize** your spreadsheets, letters, and drawings. You can attach files to Items, Orders, Customers, or Vendors. The documents are copied to a centralized file system that is accessible anywhere on your network. "Historical Notes" is an open ended tool that can be used for multiple purposes. Consider recording engineering change request on notes attached to a specific Item. Record a phone conversation with a vendor and connect it to a specific purchase order. Each user can review all their tasks in one list, no matter what it is attached to.

**Report** what is happening. A sample of what is included; quotes, bills-of-material, packing slips, bills of lading, invoices, purchase orders, sales analysis and financials. The reports are made with Crystal Reports which allows modification and customization.

#### **User Interface and Navigation**

**Simplified Menus** - One screen showing all the modules. Organized in order to connect the logic of use.

Many functions are found with right-clicking.

**Right-click for more options** - The emailing of forms is one example of the "Right-click" menu. Once something is selected the "Right-click" menu allows jumping to transactional history, cross-reference, additional functions and printing options. Also you can view inventory transactions, look up vendors or manufacturers, create a PO, and create MO from Sales orders.

**Consistent List screens** - Most functions open to a list screen. List of PO, Reminders, and GL accounts. All these windows share common buttons, layout, and method of opening and closing. The ability to move columns, searching, grouping and filtering is the same. You may drag a column to where you want and it will be back to normal the next time you open the window. Start typing in the "white" box of the highlighted row and you will find the information you want. Group the list by dragging a column to the gray area above the headings. Sort by one or more columns by clicking the gray column heading. Hold the shift key and click the gray column's headings for multiple column sorting. Click on the black triangle on the column heading for filtering options which include wildcard characters.

**Exporting Lists** - Click on either the "In Excel" or the "In a browser" buttons and in a few seconds the program has opened MS excel and displaying your list of information. This allows all kinds of uses where you need to get information out of **TechnoERP** into another program to further manipulate the data.

# Inventory

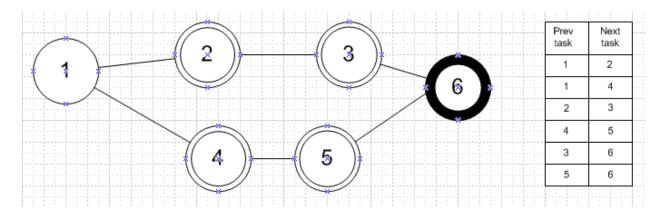

Inventory items are used in the Purchase orders, Manufacturing orders, and Sales orders in addition to the Inventory module itself. This module includes the Physical count, Inventory Transfer between multiple warehouses, Adjustment, and Transaction History. You can organize inventory by number, type, categories, and manufactured/purchased. Items are tracked internal to the program with ID thus allowing the renumbering of items at any time without losing historical information.

Connect Items needed to produce manufactured or outsourced assemblies. Define the "recipe" of what is needed. Specify any reference information per item. Define a waste percentage used in the assembly process. Use the "Effective" dates to show historical changes to the bill of material.

#### Labor Tasks (Routing)

Create list of steps that define the operations required to manufacture the product. These steps are based on "Resources" of labor. The Resources can define a machine or a group of employees. The tasks can be done in a non-linear order, as pictured above, or in a straight order.

Serial and Lot Control allow editing of what is existing (password controlled) as you see in the above screen. Once the Item is set to Serial or Lot Control every transaction is prompted with entry/selection screen. For example, when completing a MO (Manufacturing Work Order) a screen requests the numbers of the product just completed. If you do not have the numbers at that moment the system allows you to enter or edit them later. You will not be able to "Post" the MO receipt till that information is complete. Once you have the tracking number complete you may return to that screen to complete the information. The goal is to have flexibility while still retaining integrity of data.

The purchasing module allows you to manage inventory demands and track open purchase orders. This module includes the Orders and Receipts. You can create purchase orders with the status "Worksheet" for a RFQ and just change the status when you ready to place the order. The program offers two types of PO's; Standard parts ordering and Make-From for item made/assembled at a supplier with material you provide. You also can create PO's from Material Requirements Planning (MRP).

The manufacturing module contains Forecasts, Orders, Receipts, MRP - Material Requirements Planning, Scheduling, and Resources. Bill of materials and operations are copied from the inventory to the MO and thereby create allocated demand for both material and scheduled resources. Back-flushing of materials occurs when a Receipt is entered. The MRP can calculate the material needed and when. This time-phased demand information is presented in a grid then you "right-click" on the create "purchase" or "manufacturing" orders.

Sale Contacts is a combined list of "Customer" and "Prospect" contacts. The list shows the contact's name first, which allows the user to update information on those prospects, not just by company. Fields are available to differentiate between "Prospects" and "Customers", plus additional grouping and organizing fields for prospects. The "Status" field allows you the user to define in your own words how far along that prospect

Contact Us for a Free Demo at technoerp.net or call 877-413-2346 Seattle, WA · Chicago, IL · Abilene, TX is in turning them into a customer. You could define whether they have a "strong", "chance" or "weak" potential. The "Contacts" list grid was added to display all contacts in a single list even if there are more than one contact per prospect/customer. We leverage the abilities in **TechnoERP** to attach documents and create "Historical" notes for each contact.

Within the Payables module you can access vendors, enter invoices, and pay bills. An extra feature ties purchase receipts to billing thereby linking PO's to Payables. Non-inventory bills can also be entered by charging them directly to general ledger accounts.

#### **Sales Orders**

This module allows you to manage the order fulfillment process to your customers. The Sales module contains Deposits, Orders, Shipments, and Sales person information. A grid style report of history is also available. When using Orders you may start with the status of "Quote" and quickly change the status to an open order. Shipments change the outstanding quantity on order and pass the information to Receivables.

#### **Receivables**

The Accounts Receivable system tracks customer invoices and payments. Sales taxes are user defined and calculated automatically during the invoice process. Invoices print on plain paper to facilitate faxing and to avoid the expense of pre-printed forms. Adjustments, discounts, and write-offs can be entered when

entering the payment info. Invoices are not purged when fully paid, but are instead retained for sales analysis reporting. Data is passed to the GL system automatically via Journal Vouchers with revenues converted from foreign currency to domestic currency. You can trade globally in multiple currencies while your books remain in domestic currency. GL accounts for AR, discounts, and gain/loss on foreign exchange are retrieved from the currencies table.

#### Payroll

From timesheets to W2 printing, this module covers your needs. We offer a time clock labor collection option that can generate the timesheets, a barcode task scanning option, or timesheets can be filled out by the personnel themselves and submitted within the system for "approval". The employees pay check can be from a timesheet or direct entry. Federal, State and local tables are editable for the end user's updating. General ledger transactions are created with the posting of the payroll.

The General Ledger system tracks budget and actual financial data in order to produce financial statements such as an Income Statement and Balance Sheet, the Trial Balance Report, General Ledger Report, GL Totals Screen, GL History Screen, and the Bank Book.

Data is passed to the GL system from the AP and AR automatically via Journal Vouchers with expenses and revenues converted from foreign currency to domestic currency. You can trade globally in multiple currencies while your books remain in domestic currency. Data is keyed directly to the GL system via Journal Vouchers to record:

- · Initial entry of opening balances
- · Depreciation
- · Corrections and adjustments to previous GL transactions

Year-end closing entries are generated by the system.

You are able to simply cut and paste or scan a document directly into this window. Double-click on a listed document and the file will open if that program is associated with a program on that computer. Attach a file to customers, vendors, contacts, sales orders, purchase orders, items, and much more. The program automatically creates a folder structure on your server, so all can have the same access without any extra work or planning on your part. We also have a folder permission structure for shared docs, if necessary.

Most of our reports utilize *Crystal Reports* writer. This report window lets you organize all the system forms as well as the custom reports you generate. The security and password controls apply to this screen as well. Crystal reports pulls information from the data dictionary directly which allows you to delete and add fields of your choosing. Only one copy of crystal is required for the user/administrator to modify and create new reports. Other users can find these custom reports and need only to double-click on the reports to view and print them. Crystal allows the output to be in the form of screen, PDF, HTML, MS Excel and many others.

#### **Custom Charts, Graphs, and Queries**

In addition to all the built-in reporting, **TechnoERP** also gives you the ability to create your own custom charts, graphs, and queries. You can add your own SQL, accept parameters, filtering, searching, and is export-friendly. Perhaps you need to query a list then export it for further analysis, or you need an exportable CSV format for upload into your bank's portal. TechnoERP is built in such a way that you can customize it to your business. **TechnoERP** puts the power in your hands.
